IC MASTER 1979

- **FIVE MASTER SELECTION GUIDES**
  102 companies' IC's organized by type, function, key parameters
- **OVER 2400 PAGES OF TECHNICAL INFORMATION**
  Provided directly by manufacturers covering over 25,000 IC's and 46,000 Alternates
- **ALTERNATE SOURCE DIRECTORY**
  The only industry-wide, pin-for-pin version available
- **MILITARY PARTS INDEX AND CROSS REFERENCE CHART**
  Identifies all IC's with JAN qualification
- **MILITARY DEVICE TESTING TABLE**
  List companies that screen to Mil. Std. 883
- **MILITARY PARTS INDEX**
  The first function guide to JAN qualified parts
- **PART NUMBER INDEX**
  Parts from 84 manufacturers, in numerical sequence
- **APPLICATION NOTE DIRECTORY**
  Digest of currently active application note material
- **PART NUMBER GUIDE**
  Instantly decodes each company's part numbering system
- **MANUFACTURERS AND DISTRIBUTORS DIRECTORY**

IC MASTER 1979

THE FIRST STEP

IC MASTER is the **first** and **only** complete guide to Integrated Circuits. Now you can turn to the one source that has become the first step in the critical selection of Integrated Circuits. Whether an IC exists in new design or is one of thousands, you'll find it out in seconds by using the MASTER. . . .

TIME

The IC MASTER saves you time and lots of it . . . no longer do you have to spend long tedious hours and days searching through manufacturer's catalogs and data sheets for information. The MASTER gives you — at your fingertips — an easy way to narrow your IC choices quickly, accurately and systematically with the knowledge that you have just surveyed the entire industry.

IC MASTER and its quarterly updates are published by United Technical Publications, the largest electronic publisher in the world.

IC MASTER and its updates are published by United Technical Publications, Inc., Div. of Cox Broadcasting Corp., 645 Stewart Ave., Garden City, N.Y. 11530, (516) 222-2500. TWX: 510-222-1673. Sales and editorial offices: 1333 Lawrence Expressway, Santa Clara, Ca. 95051, (408) 248-8044. TWX: 910-338-0272.

A quick guide to your IC MASTER

PART NUMBER INDEX This revolutionary index takes all device types made by 102 IC manufacturers and arranges them in numerical sequence excluding prefixes or suffixes. You can now find a device number even though you do not know either the full part number or even the manufacturer. Once a basic device number is located in the index, you can obtain instant identification of all manufacturers making a device by that number and determine the full part number designation. All page references to data sheet material and any existing application notes abstracts are also provided.

PART NUMBER GUIDE An instant decoding kit. Information in this guide, provided by the manufacturers, allows you to break each company's part numbering system down into product temperature ranges, packaging variations, and functions. An invaluable tool for the elimination of costly and time consuming ordering errors caused by lack of standardization in part numbering systems.

APPLICATION NOTE DIRECTORY To prepare this directory each IC manufacturer reviewed his own application note inventory and identified all those application notes considered to be currently active. Thus, in addition to providing a directory of active application note abstracts, the IC MASTER directory also provides the first industry wide purge of obsolete material. Application note descriptions are arranged by Digital, Linear, Memory, and Microprocessor categories. Beneath those headings, material is arranged alphabetically by function and applications category. Each application note is listed by title, identifies the specific device featured, provides a 25 to 50 word abstract, and includes identity of both the authoring manufacturer and the specific application note number. This section provides all the information necessary for the engineer to update his application note files speedily or thoroughly research the existance of application note material for a specific design problem.

MILITARY PARTS DIRECTORY Cross Reference Chart identifies all IC devices having received JAN qualification. This chart includes a cross reference feature converting device numbers to Mil. Std. 38510 slash number and vice versa.

MILITARY DEVICE TESTING TABLE Lists more than 50 major manufacturers and shows, in matrix form, those device types tested to Mil. Std. 38510 as well as screening performed to Mil. Std. 883. Those companies willing to perform special screening to customer's unique military requirements are also identified.

MILITARY PARTS INDEX A "first ever" functional guide to JAN qualified parts. Now it is possible to search by device and function to determine whether a JAN qualified part exists for your application, and if so, obtain both the device and 38510 slash numbers.

©IC MASTER 1979

ALTERNATE SOURCE DIRECTORY The first industry-wide, pin-for-pin functional equivalent Alternate Source Directory ever available. This directory was developed by asking each IC manufacturer to identify each competitive device for which he made a pin-for-pin interchangeable alternate. This unique approach took nearly three years to complete, is updated quarterly, involving countless manhours of catalog searching and specification comparison.

MASTER SELECTION GUIDE This Guide, covering virtually every facet of the industry, organizes ICs into these categories: Digital, Interface, Linear, Memory and Microprocessors. In each category, products are further classified by type (CMOS, ECL, TTL, etc.) and function (Arithmetic, Counters, Gates, etc.). You'll find every IC performing that function listed by part number and manufacturer. The Five Master Selection Guides will allow you to search for ICs by your specific requirements and identify all major available devices and sources.

MANUFACTURER & DISTRIBUTOR DIRECTORY Locate the nearest local source for additional information or quick delivery of needed products. A fingertip communications guide listing the location and phone number for all manufacturer's field sales offices, reps, and distributors, both domestic and international.

QUARTERLY UPDATES This service assures that all this vast body of information is constantly refreshed. Each issue updates your Master book on a CUMULATIVE basis. Your guarantee that the IC MASTER will remain the most complete and current industry-wide source available for the first step in IC selection.

MASTER SELECTION GUIDE INDEX

Use this index to determine which of the five Master Selection Guides (Digital, Interface, Linear Memory, Microprocessor) to turn to by simply looking up alphabetically the function in which you are interested.

how to use the five master selection guides

These guides provide sufficient information to make initial product selections, to lead you to a group of device numbers and manufacturers' names. They enable you to find the products most apt to fulfill your major requirements and then provide data to help you make your final choice. All devices that appear in this section, both in the initial selection guide and in the data pages, are included in the Part Number Index. These index listings lead to the page and the line on that page where each device appears.

The coverage of industrial and consumer circuits is identified by model number and covers digital, linear and digital-linear combinations under one heading, **Linear** — Consumer Circuits. The TTL major families, TTL, TTL-LS, TTL-H and TTL-S have been combined under one heading to facilitate function comparisons. And the **Microprocessor** section has been enlarged, grouping microprocessor system components together by processor type and adding many new system descriptions.

PART NUMBER INDEX

This index shows the page and line on that page where each device appears in the Master Selection Guide. The list is prepared by a computer from the data in these sections so every device in them is listed. The devices are arranged in order by basic numbers so similarly numbered devices from various manufacturers are grouped together. Bold faced listings lead to the data supplied by the manufacturers. Use this index to locate key operational characteristics, application notes, and devices data whenever you have a model number.

how to use the part number index

This Part Number Index is arranged in alpha-numeric sequence, ignoring the manufacturer's prefixes and suffixes and using the basic model numbers. This basic number sequence is sorted by reading the digits from **left** to **right,** assuming that letters come before numbers. (As an example, these numbers would appear in the following order: 5301, 531, 54H01, 54139, 5414.) Under each basic number, the manufacturer's name and full model number is listed. The page references in **BOLD FACE** lead to manufacturers' data and application notes. Short editorial descriptions of all Active Applications Notes available from every manufacturer are indicated by a ¶ sign.

The arrangement of this index by base number gives you several advantages. It allows you to find a device by its basic number whether or not you know the name of the manufacturer or the manufacturer's prefixes. Also it groups similar devices together so that when you are looking for data you can quickly determine if the data has been provided in the book by any of the manufacturers and where that data is. Similarly it groups any references to application notes close together so that you do not need to guess which manufacturer might publish application notes on a device before you can locate them.

Once you become familiar with the alpha-numeric numbering sequence, you'll find that this index is very easy to use.

Electronics Division

eem/ELECTRONIC ENGINEERS MASTER CATALOG —

The "blue-ribbon" catalog/directory that has become "the standard of the industry" for electronic engineers, buyers and specifiers.

IC MASTER AND THE UPDATES —

The only complete single-source directory including all IC devices manufactured in the United States. Updated three times yearly with accumulative supplements.

our stuff..

cataloging, 22 editions of eem Technical Publications

Electronic Distributors MASTER CATALOG —

The only national catalog designed exclusively for distributors and their customers featuring electronic parts, instruments and equipment.

ELECTRONIC PRODUCTS MAGAZINE —

The products magazine . . . A 100% product-oriented magazine including hundreds of new products and special features every month.

eem FILE SYSTEM —

The only filing system designed especially for the electronics engineer. Instant retrieval and organization of data sheets and catalogs.

UNITED COST AND PRICING SERVICES —

The electronic distributors' proven method of being up to the minute on his cost and selling prices.

UTP CUSTOM CATALOGS —

The Cadillac of individualized catalogs for the electronic parts distributor, featuring solely his lines and services.

UTP United Technical Publications, Inc., Div. of Cox Broadcasting Corp. 645 Stewart Avenue, Garden City, New York 11530 / 516 222-2500

PART NUMBER GUIDE

Each IC manufacturer has his own special method of identifying products, usually through a system of logos, device number prefixes and suffixes. This Part Number Guide is arranged alphabetically by manufacturer and describes each company's part number system. JAN nomenclature is also covered.

Manufacturer	Part Number: Prefix	Part Number: Suffix	Example
ADVANCED MICRO DEVICES  Note: Alternate source devices follow original manufacturer's part number and marking system.	**Functional Group** 25 MSI 26 Computer Interface 27 Bipolar Memory 28 MOS 29 Bipolar Microprocessor 90 MOS 91 MOS 92 MOS 94 MOS 95 MOS **Type** L Low Power S Schottky LS Low Power Schottky (Blank) Standard	**Package** D Hermetic DIP P Molded F Flat X Dice **Temperature Range** C Commercial M Military	Prefix: AM25 — Functional Group Device: S — Type; 05 — Device Number Suffix: D — Package; M — Temperature Range
AMERICAN MICROSYSTEMS (Current)  (Discontinued)	**Family** S Standard	**Package Type** P Plastic E Cer-DIP S SLAM C Ceramic (Three Layer) T TO Type **Package/Pins** C 22 Pin Plastic or Cer-DIP D 14 Pin Plastic or Ceramic F 12 Pin TO H 16 Pin Cer-DIP, SLAM, or Ceramic I 28 Pin Cer-DIP or SLAM L 24 Pin Cer-DIP or SLAM M 40 Pin SLAM P 18 Pin Plastic or Cer-DIP T 40 Pin Plastic U 16 Pin Plastic W 24 Pin Plastic Z 28 Pin Plastic	Prefix: S — Family Device: 103X-Z — Version Suffix: P — Package Type
ANALOG DEVICES  ICs are marked with an **AD** prefix.	**AD** Analog Devices	**Temperature Range** A,B,C Industrial Range J,K,L Commercial Range S,T,U Military Range **Package** D 8 Pin Ceramic DIP DN Ceramic DIP F Ceramic Flatpack H TO-5 Type Can N Plastic DIP	Prefix: AD Device: 7516 Suffix: JN — Temperature Range; Package
BECKMAN INSTRUMENTS, INC. BECKMAN Beckman® (Discontinued)	**Family (Model Number)** 801-809, 851-859 Voltage Regulators 811-816, 862, 863 Ladder Networks 822, 823, 833, 866 Amplifiers 840 Voltage References 845-872, 877 D/A Converters 873, 876 A/D Converters 882, 883 Active Filters	**Package Type** M Metal C Ceramic G Glass **Version (Function)** I Current V Voltage **Accuracy Level** D1 Best Level D2	Prefix: 877- — Family Device: 85 — Model No.; MV- — Package Type; Version (Function) Suffix: D1 — Accuracy Level
BURR-BROWN BURR-BROWN BB		**Temperature** H, J, K, L 0°C to +70°C R, S, T −55°C to +125°C A, B, C −25°C to +85°C **Package** M Metal P Plastic Q MIL-883 Screening	Prefix: Device: 3532 Suffix: AMQ — Temperature Range; Package; MIL-883 Screening

CHERRY SEMICONDUCTOR (Micro Components)

(Older ICs may be marked with MCC prefix instead of CS prefix.)

Prefix
- CS Cherry Semiconductor
- D Diode Flip Chip
- N NPN Flip Chip
- P PNP Flip Chip

Package
- 0 Loose Component
- D Dual-In-Line
- P "Pill," Small Round Package
- T TO-Can
- 4 4 Leads
- 8 8 Leads

Circuit Style
- B National Dual Source
- S Signetics Dual Source

Prefix	Device	Suffix
CS	122	0D8
CS	555	B
D	823	

Package/Circuit

DATEL SYSTEMS

Family
- ADC A/D Converters
- AM Amplifiers
- DAC D/A Converters
- DAS Data Acquisition System
- FLT Filters
- MV, MX Multiplexer
- SHM Sample-Hold
- VF Voltage to Freq. Converters

Package — Monolithic
- 1 14 Pin DIP
- 2 TO-99

Seal — Hybrid
- G Epoxy
- M Hermetic

Temperature
- C 0°C to 70°C
- M −55°C to 125°C
- R −25°C to +85°C

Prefix	Device	Suffix
AM	490	2 A

- C — Temperature
- J — Package
- E — No. of Pins

JAN NOMENCLATURE

- **J** **JAN** Qualified Device
- **M38510** Military Designation

Device
The "Slash" numbering signifies the specification and specifies the device type. See Military Parts Directory.
Note: The J or JAN prefix is very important. If it is not there it is not a JAN device.

Device Class
- **A** Missiles and Manned Spacecraft
- **B** General Military
- **C** Less Critical Military Applications

Case Outline
- **A** ¼″ x ¼″ Flat Pack, 14-Pin
- **B** ⅛″ x ¼″ Flat Pack, 14-pin
- **C** ¼″ x ¾″ Dual-In-Line, 14-Pin
- **D** ¼″ x ⅜″ Flat Pack, 14-Pin
- **E** ¼″ x ¾″ Dual-In-Line, 16-Pin
- **F** ¼″ x ⅜″ Flat Pack, 16-Pin
- **G** 8-Lead Can
- **H** ¼″ x ¼″ Flat Pack, 10-Lead
- **I** 10-Lead Can
- **J** ½″ x 1¼″ Dual-In-Line, 24-Pin
- **K** ⅜″ x ½″ Flat Pack, 24-Pin
- **L** ⅜″ x ½″ Flat Pack, 24-Pin
- **Z** ¼″ x ⅜″ Flat Pack, 24-Pin

Lead Finish
- **A** Kovar or Alloy 42, with Hot Solder Dip
- **B** Kovar or Alloy 42, with Bright Acid Tin Plate
- **C** Kovar or Alloy 42, with Gold Plate

Prefix **Device** **Suffix**

JM38510 /XXXXX B C B

- B — Device Class
- C — Case Outline
- B — Lead Finish

LAMBDA

- **L** Overvoltage Regulator
- **LAS** Regulator
- **LPD** Dual Power Driver
- **PM** Switching Transistor
- **PMD** Discrete
- **PMR** Dual Rectifier

Prefix **Device** **Suffix**

LAS 14 12

- 12 — Voltage

MASTER LOGIC

(Most ICs are marked with ML prefix as well as purchaser's marks)

Family
- **ML** CMOS Gate Array

NATIONAL

DEVICE NUMBER (for Digital Devices):
CDXXXX-CMOS —
C Suffix −40°C to 85°C,
M Suffix −55°C to 125°C.

DM54XX — All numbers beginning with 5 denote −55°C to 125°C temperature operation.

DM74XX — If the "74" is indicated, the operating temperature is 0°C to 70°C.

DM7XXX — All other numbers beginning with 7 (besides the "74" shown above) are NSC proprietary products and a 7 here indicates −55°C to 125°C.

Linear Devices
With proprietary linear circuits, a 1-2-3 numbering system is employed.
The 1 denotes a Military temperature range device (−55°C to 125°C), the 2 denotes an Industrial device (−25°C to 85°C), and the 3 denotes a Commercial device (0°C to 70°C). i.e. LM101/LM201/LM301. Exception to this are the LM1800 Series; some hybrid circuits which employ a "C" Suffix; and second-source products which follow the original manufacturers numbering system.

Example	Prefix	Device	Suffix

Prefix	Device	Suffix
DAC	01	C Y

Grade

Package

PRO ELECTRON

First Two Letters

Digital

- **FA - FZ**
- **GA - GZ** Identify the Family
- **etc.**

Solitary Circuits

- **S** Solitary Circuit
- **T** Analog Circuit
- **U** Mixed Analog/Digital

(The second letter has no special significance, except H means Hybrid.)

Third Letter

Temperature Range

- **A** Temp. Range not specified below
- **B** 0°C to +70°C
- **C** −55°C to +125°C
- **D** −25°C to +70°C
- **E** −25°C to +85°C
- **F** −40°C to +85°C
- **G** −55°C to +85°C

If a circuit is designed for a wider temperature range, the letter indicating a narrower temperature range or the letter "A" can be used.

Device or Serial Number

Either a 4-digit number assigned by PRO ELECTRON or the serial number (even a combination of figures and letters) of an existing type designation which can be extended to a minimum of a 4-digit number by adding zeros in front of it.

Suffix or Version Letter (Recommended)

Single Letter

- **C** Cylindrical
- **P** Plastic DIL
- **D** Ceramic DIL
- **Q** Quad-In-Line
- **F** Flat Pack
- **U** (Uncased) Chip

Other letters have no fixed meaning except Z means customized wiring.

Prefix	Device	Suffix
GFB	7400	-DP
GMB	74LS00A	-DC
SAC	2000	
TDA	1000	P

Two Letters

First Letter: General Shape

- **C** Cylindrical
- **D** Dual-In-Line (DIL)
- **E** Power DIL (with External Heat Sink)
- **F** Flat (Leads on 2 Sides)
- **G** Flat (Leads on 4 Sides)
- **K** Diamond (TO-3 Family)
- **M** Multiple-In-Line (Except Dual-, Triple-, Quad-In-Line)
- **Q** Quad-In-Line (QUIL)
- **R** Power QUIL (with External Heat Sink)
- **S** Single-In-Line (as TO-127 or TO-220)
- **T** Triple-In-Line

Second Letter: Material

- **C** Metal-Ceramic
- **G** Glass-Ceramic (cerDIP)
- **M** Metal
- **P** Plastic

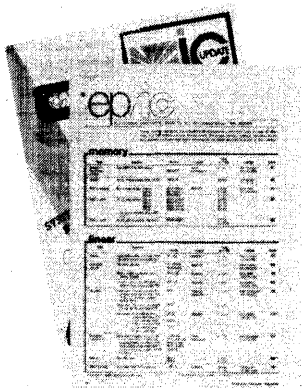
stay up to date

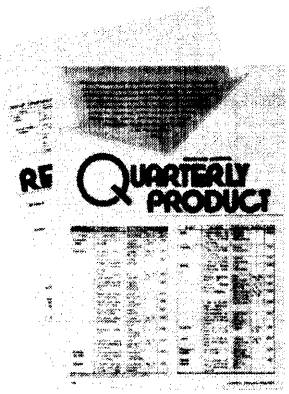
SUBSCRIBE TO ELECTRONIC PRODUCTS MAGAZINE. IT'S YOUR *COMPLETE* GUIDE TO EVERYTHING THAT'S NEW IN THE FAST-CHANGING WORLD OF ELECTRONIC PRODUCTS AND SYSTEMS.



FEATURE STORIES every month on electronic products, applications and availability.

FORUMS—Reports on meetings of manufacturers, users and distributors. Get the very latest news on a wide variety of products.

NEW PRODUCT NEWS—Hundreds of new products are introduced each month. You'll get the facts on not only what the new product is, but also where to get it, basic prices and current delivery.



EP/IC UPDATE—Exclusive in ELECTRONIC PRODUCTS. A monthly report on *everything* that's new in the fast-moving world of integrated circuits.

QUARTERLY PRODUCT REVIEW—Another exclusive in ELECTRONIC PRODUCTS. A complete report of *every* new electronic product introduced in the previous quarter. This feature is in the January, April, July and October issues.

QUARTERLY PRODUCT PLANNING DIRECTORY—A compilation of the latest catalogs of a wide variety of electronic products and systems.

OUTLOOK—Important industry news affecting electronic products and systems.

COMPONENT CAPERS—A humorous look at the strange and wonderful world of electronics.

MINI-GLOSSARIES, Quizzes and more—Each and every month for over twenty years the readers of ELECTRONIC PRODUCTS learn something new about the products they work with and specify.

GUIDE TO IC LOGOS

The following logos and symbols are provided to help you identify the manufacturers of IC products. Sometimes different marks are used on a company's products, depending upon individual package sizes.

LOGO	MANUFACTURER
AM	ADVANCED MICRO DEVICES
AMI Ai*	AMERICAN MICROSYSTEMS
ANALOG DEVICES	ANALOG DEVICES
ANALOGIC	ANALOGIC
BECKMAN Beckman*	BECKMAN INSTRUMENTS
BURR-BROWN BB	BURR-BROWN
CS MCC	CHERRY SEMICONDUCTOR (Micro Components)
	CONSUMER MICROCIRCUITS
CY	CYBERNETIC MICRO DEVICES*
DDC	DATA DEVICE CORPORATION
	DATA GENERAL
	DATEL SYSTEMS
	ELECTRONIC ARRAYS
EMM SEMI, INC. SEMI*	EMM/SEMI

LOGO	MANUFACTURER
	EXAR INTEGRATED SYSTEMS
F FAIRCHILD F*	FAIRCHILD
FERRANTI	FERRANTI
FUJITSU LIMITED	FUJITSU
	GENERAL INSTRUMENT
	HARRIS
	HITACHI
HUGHES	HUGHES AIRCRAFT
Hybrid Systems	HYBRID SYSTEMS
fmi	INTECH/FMI
	INTEGRATED PHOTOMATRIX
intel	INTEL
interdesign	INTERDESIGN

LOGO	MANUFACTURER
INTERSIL IMS*	INTERSIL
LSI	LSI COMPUTER SYSTEMS
	LAMBDA
ML	MASTER LOGIC
MN	MICRO NETWORKS
mii	MICROPAC INDUSTRIES
	MICRO POWER SYSTEMS
	MITEL SEMICONDUCTOR
	MITSUBISHI
MMI MMI*	MONOLITHIC MEMORIES
MOS	MOS TECHNOLOGY
MOSTEK	MOSTEK
M	MOTOROLA
NCR	NCR
NEC	NEC

* DISCONTINUED LOGOS PROVIDED TO IDENTIFY OLDER DEVICES.

Continued

©IC MASTER 1979

LOGO	MANUFACTURER
NS *	NATIONAL
NC *	NITRON
NORTEC	NORTEC
NPC	NUCLEONIC PRODUCTS
OKI	OKI
oei OEI *	OPTICAL ELECTRONICS
MATSUSHITA	PANASONIC (Matsushita)
PLESSEY	PLESSEY
PMI PMI *	PRECISION MONOLITHICS
RCA Solid State	RCA
RAY	RAYTHEON SEMICONDUCTOR
RETICON	RETICON

LOGO	MANUFACTURER
Rockwell	ROCKWELL (COLLINS)
SGS-ATES *	SGS-ATES SEMICONDUCTOR
	SANYO
	SIGNETICS
SILICON GENERAL	SILICON GENERAL
	SILICONIX
Si	SILICON SYSTEMS
SSS	SOLID STATE SCIENTIFIC
S S *	SOLITRON
② SPRAGUE	SPRAGUE ELECTRIC
	STANDARD MICROSYSTEMS
	SUPERTEX

LOGO	MANUFACTURER
S	SYNERTEC
	TELARIS COMMUNICATIONS (formerly Telenetics)
	TEXAS INSTRUMENTS
TMX	TMX
TRW	TRW
TELEDYNE CRYSTALONICS	TELEDYNE CRYSTALONICS
TELEDYNE PHILBRICK	TELEDYNE PHILBRICK
	TELEDYNE SEMICONDUCTOR
TELE FUN KEN TFK	TELEFUNKEN
Toshiba	TOSHIBA
	WESTERN DIGITAL
Zilog	ZILOG

* DISCONTINUED LOGOS PROVIDED TO IDENTIFY OLDER DEVICES.

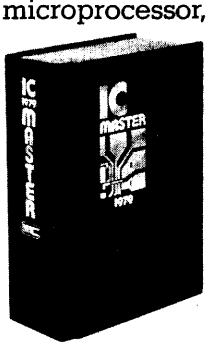
"I need to know if this device exists, and if there are any alternate sources. Where do I start?"

- Memory IC
- RAM
- Static
- 1024x1
- CMOS
- 250 Nanoseconds
- 5 Volts

If you're spending hours to solve a problem similar to the one above, you're behind the times...



It only takes a few seconds with "THE MASTER."

Clear your desk for action with the newly revised 1979 IC Master. Its all-under-one-cover features include: Over 40,000 standard products from more than 87 different companies. . . five different selection guides (memory, microprocessor, interface, linear and digital.) . . . alternate source directory for pin- for- pin, function- for- function replacements . . . applications directory. . . complete military section . . . a complete part numbering guide . . . etc.

You don't have to search through stacks of catalogs. Simply look up the specs and function you need. You don't need a part number to start with.

All you need is a problem to use The Master. Does the device exist? Who makes it? Is there an alternate source? What's the part number? Is there an applications note? Who is my closest distributor—etc.

$65.

MILITARY PARTS DIRECTORY

This section is divided into three parts: a table of those manufacturers willing to perform MIL-STD-883 screening, a two way military to commercial cross reference index, and the Qualified Parts List broken down into functions. It not only shows what devices are on the list and which manufacturers supply them, but also it decodes the military numbers into familiar terms.

how to use the military parts directory

The next page contains a table showing the manufacturers who have advised that they want to screen devices to MIL-STD-883 and/or perform other environmental screening. The table also indicates which companies are currently qualified to supply one or more devices on the QPL list. Such achievement is apt to indicate that these companies are well equipped to perform 883 testing. The following two pages provides convenient cross references between M38510 numbers and their commercial equivalents; plus indication of what devices are listed in the latest QPL.

The heart of this section is the functional QPL parts list. It is based on the latest Defense Electronics Supply Center Qualified Products List (QPL-38510-XX) at the time of publication. The revision and date of this list are indicated at the bottom of each page. Like the Master Selection Guide, the devices are classified my major functions; within each function the devices are arranged in alphanumeric order, which automatically groups CMOS together, 5400 Series together, etc.

A complete military part number includes a three letter suffix signifying the device class and packaging. The definitions of these letters are given in the Part Number Guide under "JAN Nomenclature." All the devices listed here meet class B and C requirements, a few devices (CMOS) meet class A specifications. The package styles and lead finishes that each manufacturer is qualified to supply can be determined by consulting the official QPL or by contacting the individual manufacturers. Once you have found the names of the companies you need to contact, you can reach them by using the information in the Manufacturers and Distributors Directory.

EXPLANATION:

The "MIL-M-38510" section indicates the IC manufacturers currently providing Q.P.L. ICs. More detailed information on the specific devices is given in the Qualified Products lists which follow.

The "MIL-STD-883 Screening" section lists those manufacturers who are both set up and actively want to screen devices to the levels indicated. "Other Screening" shows those who report that they want business calling for special military and industrial environment screening procedures.

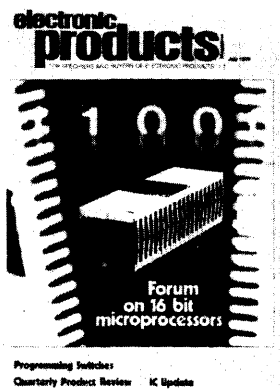
Electronics Division

eem/ELECTRONIC ENGINEERS MASTER CATALOG —

The "blue-ribbon" catalog / directory that has become "the standard of the industry" for electronic engineers, buyers and specifiers.



IC MASTER AND THE UPDATES —

The only complete single-source directory including all IC devices manufactured in the United States. Updated three times yearly with accumulative supplements.

our stuff...

cataloging, 22 editions of eem Technical Publications

Electronic Distributors MASTER CATALOG —

The only national catalog designed exclusively for distributors and their customers featuring electronic parts, instruments and equipment.

ELECTRONIC PRODUCTS MAGAZINE —

The products magazine . . . A 100% product-oriented magazine including hundreds of new products and special features every month.

eem FILE SYSTEM —

The only filing system designed especially for the electronics engineer. Instant retrieval and organization of data sheets and catalogs.

UNITED COST AND PRICING SERVICES —

The electronic distributors' proven method of being up to the minute on his cost and selling prices.

UTP CUSTOM CATALOGS —

The Cadillac of individualized catalogs for the electronic parts distributor, featuring solely his lines and services.

UTP United Technical Publications, Inc., Div. of Cox Broadcasting Corp. 645 Stewart Avenue, Garden City, New York 11530 / 516 222-2500

APPLICATION NOTE DIRECTORY

The Application Note Directory is a comprehensive guide to the many IC application notes available. It lists the devices covered, describes each note, and tells who publishes each one.

how to use the application note directory

The application notes in this directory can be located by function or device number.

1. To find out what is published by function, locate the closest topics in the index below, turn to the pages indicated, and scan through the listings.

2. To find all the application notes covering a given device, look up the device in the Part Number Index at the front of this book. The ¶ sign leads to application notes.

The application note descriptions are organized under the headings: Digital, Linear, Memory and Microprocessor. Beneath those headings are functional and applications categories arranged alphabetically. Within each category the notes are arranged in alphabetical sequence by manufacturer. The mixing of functions and applications is necessary, since application notes do not lend themselves to classification entirely by function or entirely by application. When an application note fits under several categories, it is listed in one and cross referenced by the others. This may mean that you have to spend five minutes checking a number of categories to be sure you've found everything you want, but finding suitable information can save you considerable design time.

If an application note covers specific devices or it shows in some detail how certain devices are used, these device numbers are listed in parentheses just below the title.

The application note descriptions are as short as possible. They are designed to save you time in reading while giving an overall sense of the contents. The length of each note is indicated in parentheses on the last line; if the note is bound into a book, the last line will show that it is part of a handbook, databook, catalog, etc.

Once you have determined which application notes you need, check to see if the manufacturer has placed the complete application note in the back of this section (immediately following the short descriptions). If not, contact the manufacturer's sales office or write to the manufacturer. Be sure to give both the title and the application note number. Addresses and phone numbers are listed in the Manufacturers and Distributors Directory.

DIGITAL

Arithmetic

1 **"The AM2506 — A Latching ALU"**
(AM2506)
Combines four-bit arithmetic logic unit and four-bit latch. Describes application in high-speed multiple word adder, multiple master-slave registers, 16-word arithmetic register, multiplication at 16 MHz rate.
Advanced Micro Devices Application Note (4 pg.)

2 **"Overflow Detector in Binary Adders"**
(AM9309)
Discusses the detection of overflow errors using an IC multiplexer.
Advanced Micro Devices (2 pg.)

3 **"AM25S10 Four-Bit Shifter"**
(AM25S10)
Provides functional description and discusses logic equivalents. Applications: up-shift, down and around end shifts, scaling and fixed multiplication.
Advanced Micro Devices Application Note (10 pg.)

4 **"Applications of the TTL/MSI 93S43 4-Bit by 2-Bit Two's Complement Multiplier"**
(93S43)
How to implement a combinatorial multiplication array of any size for two's complement numbers. How to multiply in other number representations. Speed/hardware tradeoffs, normalization of floating point numbers after multiplying, rounding or truncation of double length products.
Fairchild Application, Note 329 (15 pg.)

5 **"MECL 10,000 Arithmetic Elements MC10179, MC10180, MC10181"**
See listing under (Digital) High Speed Logic (Motorola).

6 **"NBCD Sign and Magnitude Adder/Subtracter"**
(MC14560, MC14561)
Describes CMOS parallel adder-subtracters for both signed and unsigned natural binary coded decimal (NBCD) numbers.
Motorola AN-738 (7 pg.)

7 **"High-Speed TTL Adders"**
(DM5483, DM7483)
Describes 16-bit parallel adders, using the DM7283/DM8383, and connections for ripple-carry addition. Also describes BCD adder techniques implemented with these devices. Shows how the devices can be used to improve the performance of MOS storage systems.
National AN-35 (6 pg.)

8 **"Arithmetic Arrays Using Standard COS/MOS Building Blocks"**
(CD4001, CD4008, CD4011, CD4013, CD4019)
Describes design of a 32-bit full adder/arithmetic logic system. Discusses four-bit full adder, quad AND-OR select gate, dual D-type flip-flop, input NAND gates, input NOR gates, and arithmetic register.
RCA ICAN-6600 (6 pg.)

9 **"COS/MOS Rate Multipliers — Versatile Circuits for Synthesizing Digital Functions"**
(CD4089, CD4527)
Describes operation of a rate multiplier, and the effects of cascading. Covers addition, subtraction, multiplication, division, square and higher order roots, frequency ratios and integration. Also discusses symmetric operations.
RCA ICAN-6739 (12 pg.)

10 **"Converting To and From Binary Using the SN74184 and SN74185A"**
(SN74184, SN74185A, SN74283, SN74284, SN74285)
Compares conventional shift and add technique to conversion from binary to BCD using the 74185A. Tells how to interconnect these converter packages for 6-bit through 20-bit binary inputs and 4, 5 or 6 decade BCD inputs. Describes conversion of fractions using the 74283, 74284 and 74285.
Texas Instruments Application Report CA-171 (19 pg.)

11 **"Fast Multipliers Using TTL Read Only Memories"**
See listing under (Memory) ROMs. (Texas Instruments)

CMOS

12 **"Intrinsically Safe Data Acquisition"**
Presents methods by which CMOS circuitry can be used in the construction of intrinsically safe low-level multiplexers, A/Ds, and instrumentation amplifiers.
Burr-Brown AN-84 (4 pg.)

13 **"Minimizing Gate Oxide Failures Due to Handling"**
Describes oxide failure mechanisms, evaluates input protection techniques, and recommends handling procedures to avoid failure.
Harris Application Report 208 (3 pg.)

14 **"CMOS: Some Application Guidelines"**
Presents General Guidelines when using CMOS.
Harris Application Note 209 (7 pg.)

15 **"Using Junction Isolated CMOS"**
Covers problems and application rules related to forward biasing CMOS inputs and outputs.
Harris Application Note 210 (4 pg.)

16 **"Avoiding CMOS Noise-Sensitivity Problems"**
Describes noise sensitivity problems peculiar to MOS technologies and solutions to these problems.
Harris Semiconductor AN-211 (6 pg.)

17 **"CMOS Analog Multiplexers and Switches; Applications, Considerations"**
Covers selection criteria, parameter definitions, handling and design precautions, typical applications, and other topics concerning CMOS analog multiplexers and switches.
Harris Semiconductor AN-520 (9 pg.)

18 **"Getting the Most Out of CMOS Devices for Analog Switching Jobs"**
Describes latch-proof junction isolation, floating-body junction isolation, and dielectric isolation as solutions to CMOS problems when applied to analog design.
Harris Semiconductor AN-521 (7 pg.)

19 **"MasterMOS, a Custom CMOS System"**
(MasterMOS)
Describes the construction of these devices which are customized by changing the metalization pattern.
International Microcircuits (6 pg.)

20 **"MasterMOS Design Manual"**
(MasterMOS)
Detailed instructions and drawing for customizing these arrays.
International Microcircuits $35.00 (70 pg.)

DIGITAL

CMOS (cont)

1 **"A New CMOS Analog Gate Technology"**
See listing under (Linear) Switches. (Intersil)

2 **"NBCD Sign and Magnitude Adder/Subtracter"**
See listing under Arithmetic (Motorola)

3 **"A 3½ Digit DVM Using an Integrated Circuit Dual Ramp System"**
See listing under (Linear) Instrumentation (Motorola)

4 **"Noise Immunity Comparison of CMOS Versus Popular Bipolar Logic Families"**
Compares the noise immunities of TTL, DTL, HTL, and CMOS logic families. Discusses common noise sources, precautions against noise, noise specification, and standard noise tests.
Motorola AN-707 (8 pg.)

5 **"Introduction to CMOS Integrated Circuits with Three-State Outputs"**
Describes a wide variety of CMOS ICs incorporating transmission gates with standard logic. Gives design rules. Covers applications in analog switching and multiplexing, digital multiplexing, and data bussing.
Motorola AN-715 (19 pg.)

6 **"Scanning Logic for RF Scanner-Receivers Using CMOS Integrated Circuits"**
Describes rf scanner-receiver control functions using standard CMOS devices. Covers crystal switching and priority channel monitoring with mention of phase-locked loop designs.
Motorola AN-753 (7 pg.)

7 **"CMOS Monostable Multivibrators"**
(MC14538B)
Covers theory of operation with emphasis on pulse widths, retriggerable and non-retriggerable operation. Describes use in a tachometer.
Motorola AN-772 (7 pg.)

8 **"CMOS Linear Applications"**
(MM74C00, MM74C02, MM74C04)
Describes use of CMOS devices biased to operate at the midpoint of the transfer characteristics.
National AN-83 (3 pg.)

9 **"CMOS Oscillators"**
Describes square wave oscillators that can be built with CMOS logic elements.
National AN-118 (4 pg.)

10 **"54C/74C Family Characteristics"**
(MM54C Series, MM74C Series)
Discusses output, noise and temperature characteristics, power consumption, and propagation delay for the 54C/74C logic family.
National AN-90 (6 pg.)

11 **"MM54C/74C Voltage Translation/Buffering"**
See listing under Interface (National)

12 **"Designing with MM74C908, MM74C918 Dual High Voltage CMOS Drivers"**
(MM74C908, MM74C918)
Presents curves for power dissipation design limits. Shows simple driver circuits plus flasher, oscillator, siren and latch applications.
National AN-177 (12 pg.)

CMOS (cont)

13 **"COS/MOS Integrated Circuits Manual"**
(CD4000 series)
Discusses fabrication, logic system design, and applications of RCA COS/MOS circuits.
RCA CMS-272 $2.50 (224 pg.)

14 **"Noise Immunity of COS/MOS Integrated-Circuit Logic Gates"**
(CD4000A, CD4001A)
Evaluates noise immunity of the CD4000A/01A gates with respect to external noise, crosstalk, transmission-line reflections, power-line noise, and ground-line noise. Includes schematics and logic diagrams.
RCA ICAN-6176 (8 pg.)

15 **"A Typical Data-Gathering & Processing System Using CD4000A-Series COS/MOS Parts"**
(CD4000 Series)
Describes data-gathering and processing system using CMOS circuits. Includes discussion of input signal conditioning and transmission, the digital processor unit, receiver, memory, arithmetic unit, display unit, output buffer, output transmitter, receiver, and control unit.
RCA ICAN-6210 (11 pg.)

16 **"Radiation Resistance of the COS/MOS CD4000A Series"**
(CD4000A Series)
Provides a graph plotting permanent radiation resistance of CD4000A series. Discusses design considerations for increasing resistance.
RCA ICAN-6224 (2 pg.)

17 **"Guide to Better Handling and Operation of CMOS integrated Circuits"**
Recommends specific handling and operating practices to minimize the probability of damage in the manufacturing and field environments.
RCA ICAN-6525 (5 pg.)

18 **"Using the CD4047A in COS/MOS Timing Applications"**
(CD4047)
Compares this monostable-astable multivibrator with simpler types of oscillator circuits and discusses applications, including a noise discriminator, low-pass and band-pass filters, a frequency discriminator, and a pulse generator.
RCA ICAN-6230 (13 pg.)

19 **"Astable and Monostable Oscillators using RCA COS/MOS Digital Integrated Circuits"**
(CD4000 Series)
Describes several techniques used to compensate for the normal threshold variation of MOS devices in the design of stable multivibrator circuits for operation at frequencies up to 1 MHz. Also covers applications for multivibrator circuits including VCOs, voltage controlled pulse-width circuits, and phase-locked VCOs.
RCA ICAN-6267

20 **"A COS/MOS PCM Telemetry and Remote Data Acquisition Design"**
(CD4000 Series)
Describes data transmission formats and the following data acquisition sections: analog and digital multiplexers, A/D converters, transmission formatters and system programmers.
RCA ICAN-6289 (12 pg.)

©IC MASTER 1979

DIGITAL

CMOS (cont)

1 **"Power Supplies for COS/MOS"**
(CD4000 Series)
Discusses the factors involved in the selection of CMOS supply voltages including the system operating frequency, noise immunity and power dissipation. Examples of simple power supply circuits are also given.
RCA ICAN-6304 (5 pg.)

2 **"Applications of the RCA-CD4093B COS/MOS Schmitt Trigger"**
(CD4093B)
Describes characteristics of the CD4093 quad 2-input Schmitt trigger. Covers applications in waveshaping (sinewave to square-wave, edge delay, edge detection), power-on reset, astable multivibrators and use as a Schmitt trigger for noise immunity.
RCA ICAN-6346 (6 pg.)

3 **"Using the CD4520B to Design Dividers with Symmetrical Outputs"**
(CD4520B)
Describes how to use this CMOS counter to divide an input frequency by N where N is any integer from 2 to 256 and obtain outputs with approximately 50% duty cycles.
RCA ICAN-6362 (10 pg.)

4 **"Fundamentals of Testing COS/MOS Integrated Circuits"**
Describes the techniques employed in testing CMOS devices to assure their adherence to data sheet specs.
RCA ICAN-6532 (14 pg.)

5 **"Understanding Buffered and Unbuffered CMOS Characteristics"**
Presents the relative merits of buffered and unbuffered CMOS devices. Provides background, definitions, and an applications chart.
RCA ICAN-6558 (8 pg.)

6 **"Radiation Resistance of the COS/MOS CD4000A and CD4000B Series"**
(CD4000 Series)
Studies permanent and transient radiation as they affect CMOS devices.
RCA ICAN-6563 (3 pg.)

7 **"Applications of CD40107BE COS/MOS Dual Buffer"**
(CD40107BE)
Details the characteristics of the CD40107BE and the variety of applications including a lamp driver, an LED driver, and a relay driver.
RCA ICAN-6564

8 **"COS/MOS Electrostatic-Discharge Protection Networks"**
(CD4000 Series)
Discussion and illustrations of the various electrostatic-discharge protection networks provided on RCA CMOS parts.
RCA ICAN-6572 (2 pg.)

9 **"Power-Supply Considerations for COS/MOS Devices"**
(CD4000 Series)
Includes discussion of quiescent device dissipation, switching characteristics, ac dissipation and ac performance characteristics, calculating system power, power supply regulation and filtering requirements.
RCA ICAN-6576 (6 pg.)

CMOS (cont)

10 **"Noise Immunity of COS/MOS B-Series Integrated Circuits"**
(CD4000UB Series, CD4000B Series)
Evaluates noise immunity of B-series CMOS devices with respect to noise-energy immunity, and dc/ac noise-immunity. Includes definitions of test terms, discussion of logic-system noise and rejection, and schematics.
RCA ICAN-6587 (9 pg.)

11 **"Interfacing Analog and Digital Displays with CMOS Integrated Circuits"**
(CD4000 Series)
Details some of the CMOS ICs most suitable for interfacing the electronic circuit and the display. For digital displays, basic display operation is also covered as an aid in selecting the appropriate interfacing device.
RCA ICAN-6595 (12 pg.)

12 **"Interfacing COS/MOS with Other Logic Families"**
(CD4000A Series)
Describes conditions governing interface of CMOS 4000A series with other logic families.
RCA SSD-203 ICAN-6602 (12 pg.)

13 **"Battery-Powered Digital-Display Clock/Timer and Metering Applications Utilizing the RCA CD4026A and CD4033A Decade Counters 7-Segment Output Types"**
(CD4009, CD4010, CD4026, CD4033)
Describes the CD4026A/33A ICs and their use with 7-segment display units. Discusses interface packages and methods to help the designer optimize his system. Includes a discussion of battery-operated systems for digital clocks and watches.
RCA ICAN-6733 (16 pg.)

14 **"CMOS/MOS Interfacing Simplified"**
See listing under (Digtial) Interface (RCA)

15 **"CMOS/MOS Rate Multipliers — Versatile Circuits for Synthesizing Digital Functions"**
See listing under (Digital) Arithmetic (RCA)

16 **"Design of Fixed and Programmable Counters Using the RCA 4018A COS/MOS Presettable Divide-by-"N" Counter"**
See listing under (Digital) Counters. (RCA)

17 **"Application of CD4016A Quad Bilateral Switch"**
See "Transmission and Multiplexing of Analog or Digital Signals Using the CD4016A Quad Bilateral Switch" Under (Digital) Data Transmission. (RCA)

18 **"Using Complementary MOS Circuits"**
(SCL4013A, SCL4046A, SCL4018A, SCL4026A, SCL4029A, SCL4404A)
Reviews CMOS operation, cost, and reliability. Discusses application of the SCL4018A in a three decade rate multiplier; the SCL4029A in counting devices; the SCL4404A and SCL4031A in A/D converters; and SCL4016A in analog switching.
Solid State Scientific AN-101 (6 pg.)

19 **"CMOS Expandable Gates"**
(SCL4402A, SCL4412A)
Compares the transfer characteristics of ordinary CMOS gates to those gates using double buffered output. Includes performance characteristics and discusses expansion of SCL4412A and SCL4402A to 12-input NOR, 16-input OR, and other combinations.
Solid State Scientific AN-102 (3 pg.)

DIGITAL

CMOS (cont)

1 **"CMOS Integrated Circuits in Automotive Applications"**
General discussion, also includes discussion of high current circuits, constant current or constant impedance circuit, digital time delay circuit, digital low-pass filter.
Solid State Scientific AN-103 (5 pg.)

2 **"Interfacing with CMOS"**
Describes electrical characteristics of CMOS inputs and outputs. Discusses interfacing CMOS with CMOS, PMOS, NMOS, DTL/TTL, HTL, and CL.
Solid State Scentific An-104 (5 pg.)

3 **"Improved CMOS Gate Design"**
(SCL4000 Series)
Description of the output buffering of the SCL4000 Series
Solid State Scientific AN-105 (3 pg.)

4 **"A Simplified Approach to Testing CMOS Inverters and Gates"**
Bench tests using a lower supply and a V-O-M are described. They include continuity, input leakage, quiescent device current, output voltage, noise immunity, output drive current and threshold voltage.
Solid State Scientific AN-107 (4 pg.)

5 **"Applications of CMOS Integrated Circuits in Communications Equipment"**
(SCL4000 Series)
Uses of SCL4000 Series circuits as frequency synthesizers, digital frequency displays, frequency scanners, and squelch circuits.
Solid State Scientific AN-108 (4 pg.)

6 **"CMOS Wave Shaping and Level Detection"**
Describes methods to obtain modified transfer charactertistics of double buffered NAND gates, by connecting inputs together, connecting extra inputs to V_{cc}, etc. Shows how to obtain variable amounts of hysteresis, and describes systems of level detection using trigger circuits.
Solid State Scientific AN-109 (5 pg.)

7 **"Using the SCL 4528 Dual Monostable Multivibrator"**
(SCL4528)
Describes operating modes and timing, equations for pulse width calculations.
Solid State Scientific AN-111 (6 pg.)

Consumer

8 **"A Navigation Receiver That Uses A Digital Frequency Synthesizer"**
(μA719)
Gives schematics for a navigation receiver. Discusses the digital frequency synthesizer, varactor tuned RF amplifier, AGC amplifier, mixer, IF amplifier, and detector portions.
Fairchild Application Note 178 (6 pg.)

9 **" 'Little Teacher'. Using the C593/C597 Calculator Circuit"**
(C/CF593, C/CD597)
Describes a calculator circuit used as a teaching toy. If a child answers a given problem correctly a pass lamp is lit; otherwise a fail lamp is lit.
General Instrument Bulletin 0202 (3 pg.)

Consumer (cont)

10 **"12/24 Hour Digital Auto Clock"**
(AY9-1000, CK3300)
Provides circuit diagram and description of a 12 or 24 hour auto clock.
General Instrument Bulletin 0301 (3 pg.)

11 **"Industrial Clock/Timer Featuring Back-up Power Supply Operation"**
Describes the design and operation of a clock timer with digital readout suitable for industrial control applications. CMOS circuits are used for reduced power.
Motorola AN-718A

12 **"Calculator Learns to Keep Time"**
Describes stopwatch and keyboard controlled interval timing functions using the MM5736 calculator chip.
National AN-119 (8 pg.)

13 **"Handheld Calculator Battery Systems"**
Describes the tradeoffs in battery performance for 6.5-9.5v calculators driven by 2, 3 and 4 cell as well as 9v. batteries.
National AN-149 (4 pg.)

14 **"High Voltage Shift Registers Move Displays"**
See listing under (Memory) Shift Registers (National)

15 **"Timekeeping Advances Through COS/MOS Technology"**
Discusses basic oscillator design considerations, practical oscillator circuits, and some typical timing-circuit applications, including wrist watches, wall clocks, and auto clocks.
RCA ICAN-6086 (12 pg.)

16 **"CMOS Integrated Circuits in Automotive Applications"**
See listing under (Digital) CMOS. (Solid State Scientific)

17 **"Automotive Electronics: Choosing the Right Technology"**
Defines operational considerations and compares CMOS, PMOS, and bipolar.
Sprague TP 74-5 (10 pg.)

Counters

18 **"Single IC Forms 2-to-9-Bit Ring Counter"**
(AM2503)
Describes use of device to make a ring counter.
Advanced Micro Devices (2 pg.)

19 **"Design for a Battery Operated Frequency Counter"**
(ICM7207A, ICM7208)
Describes the design, circuit and layout of a 7 digit frequency and period measurement counter.
Intersil A015 (6 pg.)

20 **"Using the MK5009P MOS Counter Time-Base Circuit"**
(MK5009)
Describes the use of the MK5009 along with complete circuits for a digital frequency meter, pulse generator and digitally-programmable one-shot. Discusses operation of the units oscillator circuit.
Mostek AN-104 (4 pg.)

©IC MASTER 1979

DIGITAL

Counters (cont)

1 **"Applications Using the MK50395 Six Decade Counter Display Totalizer"**
(MK50395, MK50396, MK50397)
Discusses use of the counter in batch control position measurement, greater-than less-than detection, automatic stop, frequency counter, darkroom timer, digital tuning, and N-Pulser applications.
Mostek (16 pg.)

2 **"Application Information Using Mostek's Six-Decade Counter/Display Totalizer"**
(MK50395)
Covers circuit operation and input/output requirements. Describes use in a batch control system, a position measurement system and greater-than less-than detection.
Mostek (8 pg.)

3 **"Programmable Counters Using the MC10136 and MC10137 MECL Universal Counters"**
(MC10136, MC10137)
Circuit operation and use in programmable counters with no external gating. Also use in high-frequency counters operating up to 110 MHz.
Motorola AN-584 (4 pg.)

4 **"Battery-Powered 5 MHz Frequency Counter"**
Describes a battery operated 5 MHz counter built with CMOS for low power operation. Discusses methods to minimize power consumption.
Motorola AN-717 (9 pg.)

5 **"A 200 MHz Autoranging MECL-McMOS Frequency Counter"**
(MC10000 Series)
Presents basic frequency counter design along with the schematics and diagrams needed to build a 200 MHz autoranging frequency counter.
Motorola AN-742 (11 pg.)

6 **"Five Digit Accumulator/Elapsed Time Indicator"**
(MC14534)
Describes in detail the circuit for a CMOS 5 digit elapsed time indicator and a 99,999 count accumulator with a 1-999 prescaler.
Motorola AN-743 (5 pg.)

7 **"The Logical Design of Shift Counters"**
Presents two techniques to aid in designing shift-register counters. Gives results for "sequence tree" and "count multiplication" techniques for cycle lengths of 30 or less. Shows solutions for both "D" flip-flops and J-K flip-flops as the input elements of the shift register.
Motorola AN-576 (8 pg.)

8 **"An MSI 500 MHz Frequency Counter Using MECL and MTTL"**
See listing under High Speed Logic. (Motorola)

9 **"Calculator Chip Makes A Counter"**
(MM5736, MM5739)
Discusses use of the MM5736 calculator chip as a counter operating up to 120 Hz.
National AN-112 (6 pg.)

10 **"Keyboard Programmable Divide-by-"N" Counter with Symmetrical Output"**
(MM54C922, MM74C922)
Describes a circuit to divide by 1 through 16 by pushing a single key for each division ratio.
National DB-5 (2 pg.)

Counters (cont)

11 **"Design of Fixed and Programmable Counters Using the RCA 4018A COS/MOS Presettable Divide-by-"N" Counter"**
(CD4018)
Describes the use of this device in single-decade and multi-decade fixed and programmable divide-by-"N" counters. System considerations, such as switch simplifications, components minimization, and speed are also discussed.
RCA ICAN-6498 (6 pg.)

12 **"A Basic Selection Guide to Digital Counters"**
(CD4017, CD4024, CD4518)
Discusses the advantages of the binary ripple counter and compares it with the Johnson decade counter and the BCD counter. Also covers selection of the most suitable counter for specific applications.
RCA ICAN-6552 (6 pg.)

13 **"Using the SN74160 Family of Synchronous Counters"**
(SN74160, SN74161, SN74162, SN74163)
Describes carry circuit operation, cascading and programming.
Texas Instruments Application Report CA-174 (7 pg.)

Data Transmission

14 **"Line Drivers and Receivers"**
(AM2614, AM2615, 9614, 9615, 9620, 9621, DM7831, DM8831)
Discusses single ended, differential, unbalanced differential digital communications systems and line matching methods. Describes the above circuits and their use in systems.
Advanced Micro Devices Application Note (12 pg.)

15 **"Remote Multiplexing"**
Discusses acquisition of data at sensors distant from the location where the data is required and the control of actuators at a distance from the control system. Topics include interconnection, data transmission integrity, temperature, and electrical and mechanical protection.
Burr Brown AN-80 (6 pg.)

16 **"Distributed Data Processing"**
Outlines design considerations dealing with remote data acquisition systems. Discusses distributed data processing and related topics such as system reliability, maintenance, network configurations and partitioning, and data base management.
Burr Brown AN-81 (5 pg.)

17 **"Intrinsically Safe Data Acquisition"**
See listing under (Digital) CMOS. (Burr-Brown)

18 **"Stable FSK Modems Featuring the XR-2207, XR-2206, and XR-2211"**
(XR2206, XR2207, XR2211)
Describes designing a modulator-demodulator for use in frequency-shift keying. Circuit designs and the adjustment procedure for frequency tuning is included.
Exar AN-01 (5 pg.)

19 **"Tri-State FSK Modem Design Using XR2206/XR2211"**
(XR2206, XR2211)
Design of FSK modems with carrier detection and control capability are discussed.
Exar AN-05

Data Transmission (cont)

1 **"Using the Data Concentrator in Data Communications"**
(AY5-1016)
Presents description of device and outlines general operating considerations. Provides schematics of its use in a commutator/decommutator, a polling system, and a digitally programmed gain amplifier.
General Instruments Bulletin 0801 (8 pg.)

2 **"Using the UAR/T in Data Communications"**
Describes device and operation of both receiver and transmitter portions of circuit. Outlines use in computer interfacing, terminal interfacing, and a location identifier.
General Instruments Bulletin 0802 (6 pg.)

3 **"The UAR/T in Data Communications"**
(AY5-1013)
Describes this full duplex receiver/transmitter and discusses its application in computer, terminal and slow speed device interfacing. Also covers use in polling.
General Instrument Microelectronics (4 pg.)

4 **"Using the Data Concentrator in Data Communications"**
(AY5-1016)
Describes counter, decoding matrix, and multiplexer switch sections of the AY5-1016 data concentrator. Describes commutator.decommutator and polling system applications plus use as a digitally programmable gain amplifier, and as a clock generator.
General Instrument Microelectronics (11 pg.)

5 **"The AY-5-1011 Terminal Transmitter for Key-To-Tape Data Accumulation System and Other Applications"**
(AY5-1011)
Describes features of this parallel-to-serial converter and discusses its use in key-to-tape systems.
General Instruments Microelectronics (6 pg.)

6 **"High Speed Digital Communications"**
(HD245, HD246, HD545, HD546)
Describes the use of the HD-245 family in a current mode digital communication system (up to 2 Mbs over 1,000-ft-long line.)
Harris Application Note 205 (4 pg.)

7 **"Receiver/Transmitter Noise Immunity"**
(HD245, HD246, HD545, HD546)
Discusses HD-245 transmitter/receiver system noise: External magnetic and capacitive effects, crosstalk, and ground line noise. Includes a comparison with voltage mode and differential voltage switching type systems.
Harris Application Note 207 (4 pg.)

8 **"Using the 8251 Universal Synchronous/Asynchronous Receiver/Transmitter"**
(8251)
Describes this USART, covering its use as a component and as a communication-link in 8080 systems. Includes flowcharts and program listings.
Intel Application Note AP-16 $1.00 (32 pg.)

9 **"Using the 8273 SDLC/HDLC Protocol Controller"**
(8273)
Explains the 8273 as a component and shows its use in a generalized loop configuration.
Intel AP-36 (44 pg.)

Data Transmission (cont)

10 **"Bussing with MECL 10,000 Integrated Circuits"**
(MC10111, MC10123)
Describes use of MECL 10,000 circuits in high speed data transmission systems with emphasis on transmission line construction and termination.
Motorola AN-726 (6 pg.)

11 **"Low Speed Modem Fundamentals"**
(MC6860)
Describes interface circuitry and performance of the MC6860 low speed modem. Evaluation of the system performance in the presence of Gaussian noise is given, as well as a brief description of data couplers.
Motorola AN-731 (15 pg.)

12 **"Low Speed Modem System Design Using the MC6860"**
(MC6860)
Describes the MC6860 modem. Provides filter design tables and equations to develop a complete 100 series compatible system.
Motorola AN-747 (13 pg.)

13 **"Device Operation and System Implementation of the Asynchronous Communications Interface Adapter"**
(MC6850)
Provides information on ACIA transmitter and receiver operation, initialization, status register bits, use in a microcomputer based communications system, software requirements, and transmission subroutines.
Motorola AN-754 (11 pg.)

14 **"Revised Data — Interface Standards"**
(MC3486, MC3487, MC3488)
Compares RS232, RS422, and RS423 standards and discusses cable length.
Motorola AN-781 (4 pg.)

15 **"Integrated Circuits for Digital Data Transmission"**
(DS7820, DS7830, DS8820, DS8830)
Describes the operation and use of the DS7830 line driver and DS7830 line receiver for transmission systems using twisted-pair lines. Includes a mathematical design analysis of this line receiver.
National AN-22 (16 pg.)

16 **"Data Bus and Differential Line Drivers and Receivers"**
(DS7820, DS7830, DS7831, DS7832, DS7833, DS7834, DS7835, DS7836, DS7837, DS7838, DS7839, DS8820, DS8830, DS8831, DS8832, DS8833, DS8834, DS8835, DS8836, DS8837, DS8838, DS8839, DS1488, DS1489)
Includes schematics and describes the operation of these line drivers, receivers and transceivers.
National AN-83 (12 pg.)

17 **"Transmission Line Characteristics"**
(DM7400, DS7820, DS7830, DS75452, DS8820, DS8830)
Describes the characteristics of digital signals in transmission lines and the characteristics of the line that effect transmission quality. Also compares the performance of unbalanced and balanced circuits in digital systems.
National AN-108 (6 pg.)

18 **"Operational Aspects of Nitron's Data Terminal Transmitter and Receiver"**
(NC2257, NC2259, NC2260)
Discusses basic operation of the NC2257/2259/2260 IC's, and application in various types of communications systems.
Nitron Communications Note 1 (24 pg.)

©IC MASTER 1979

DIGITAL

Data Transmission (cont)

1 **"Using High Speed Memory in Pulse Code Modulated Systems for Switching Applications"**
Discusses digital message switching and implementation with a conventional digital crossbar switch as well as with a switch using high speed memory and data multiplexing.
Nortec Applications Note. No. 29 (4 pg.)

2 **"Transmission and Multiplexing of Analog or Digital Signals Utilizing the CD4016A Quad Bilateral Switch"**
(CD4016A)
Describes features and operation of this switch. Discusses applications, including switching, gating digital or analog signals, multiplexing and demultiplexing, D/A conversion, sample and hold, and squelch-control.
RCA ICAN-6601 (12 pg.)

3 **"A COS/MOS PCM Telemetry and Remote Data Acquisition Design"**
See listing under (Digital) CMOS (RCA)

4 **"A Typical Data-Gathering and Processing System Using CD4000A-Series COS/MOS Parts"**
See listing under (Digital) CMOS (RCA)

5 **"Asynchronous Receiver/Transmitter"**
(TR1602)
General description of asynchronous transmission and operation of TR1602, which is capable of full or half duplex operation. Describes application in distributed computer networks.
Western Digital Application Report 1 (12 pg.)

Encoders

6 **"Using the AY-5-9100 in Telephone Equipment"**
(AY5-9100)
Describes use of this four phase dynamic logic circuit in mains powered dialers, line powered telephones, card readers, and in standard multifrequency tone dialer keyboards.
General Instrument Microelectronics (10 pg.)

7 **"Keyboard Encoder and PROM/EPROM Application"**
(AY5-3600)
Describes use of the device in 64 key 4 mode and 90 key 4 mode applications. The device's binary outputs are organized to provide direct interface with a PROM/EPROM thus enabling the specific pattern format to be verified prior to a "custom" encoder commitment.
General Instrument Bulletin 1401 (4 pg.)

8 **"AY5-3600 Keyboard Encoder Operation"**
(AY5-3600)
Characterizes the device and supplies a chart of the code assignments it uses.
General Instrument Bulletin 1402 (3 pg.)

9 **"Designing with the HD-0165 Keyboard Encoder"**
(HD0165)
The organization and truth table for this encoder are presented. The use of two circuits for encoding up to 256 keys, battery operation, examples of a teletypewriter keyboard and universal keyboard encoders are described.
Harris Application Note 204 (8 pg.)

Encoders (cont)

10 **"Using the MM5704 Keyboard Interface in Keyboard Systems"**
(MM5704)
Discusses features, operation, and programming of this device. Discusses use with the MM5702 timing and control chip of the Microprogrammable Arithmetic Processing System, and in a standard ASCII encode system.
National AN-52 (11 pg.)

11 **"MOS Encoder Plus PROM Yield Quick Turnaround Keyboard Systems"**
(MM5740)
Describes use of a binary coded keyboard encoder with a PROM to build prototype or small volume keyboard systems.
National AN-139 (4 pg.)

12 **"Exclusive-OR Code Converters"**
(DM7086)
Covers use of exclusive-OR gates to do Gray/Binary and Binary/Hamming code conversion.
National DB-2 (2 pg.)

13 **"Interface Circuitry and Performance Optimization TMX2141 Encoder, TMX2151 Decoder"**
(2141, 2151)
Provides design notes including pulse width and timing considerations for these pulse width signaling devices.
TMX Bulletin 751 (7 pg.)

General

14 **"Don't Be Confused by Switching Time Specifications"**
Uses a TTL J-K flip-flop to explain switching time specifications.
Advanced Micro Devices (4 pg.)

15 **"HMOS Reliability"**
Describes HMOS technology and device operation. Presents failure mechanisms, reliability testing, and test results.
Intel RR-18 (9 pg.)

16 **"Worst Case Design For Integrated Circuits"**
(MONOCHIP)
Discusses defining worse case conditions of an IC design parameter variations, breadboarding for verification of worse case conditions and parasitic effects.
Interdesign APN-2 (5 pg.)

17 **"How Cost Effective Are Custom IC's?"**
(MONOCHIP)
Looks at the relative economies of discrete circuit designs versus semicustom IC's at various volume levels. Economic costs often not analyzed such as rework, supervisory overhead, inventory maintenance, quality assurance, and purchasing and stocking costs are included.
Interdesign APN-5 (6 pg.)

18 **"MOS 100-Bit Word Generator"**
Describes how to build a 100-bit word generator using MOS ICs.
National MB-1 (2 pg.)

19 **"MOS Clock Savers"**
Design and use of MOS Clock-Drive Networks. Offers tips for saving power and lowering component costs.
National MB-5 (2 pg.)

DIGITAL

General (cont)

1 **"Solid-State Devices Manual"**
Provides tutorial information on discrete devices and IC's with emphasis on consumer, hobbyist and experimenter applications.
RCA SC-16 $5.00 (750 pg.)

2 **"Criteria for Choosing Resins and Evaluation Tests for Discrete and Integrated Power Devices in Plastic Packages"**
See listing under (Linear) General (SGS-ATES)

High Speed Logic

3 **"F10,000 Series ECL"**
(ECL Series)
Operation and circuit parameters are described for the Fairchild ECL series.
Fairchild Application Note 330 (6 pg.)

4 **"IC Crystal Controlled Oscillators"**
(MC1023, MC1662, MC10101, MC10116)
Describes use of MC1023 OR/NOR gate as an amplifier and oscillator. Discusses square wave oscillator circuits with crystal control capable of output frequencies up to 150 MHz. Examples use MC10116/10101, and MC1662.
Motorola AN-417B (4 pg.)

5 **"The MC1600 Series MECL III Gates"**
(MC1660, MC1661, MC1662, MC1663, MC1664, MC1665)
Gives typical operating characteristics and explains the operation of various gates in the MECL III family. Describes recommended layout, breadboarding, and testing procedures.
Motorola AN-504 (14 pg.)

6 **"Interconnection Techniques for Motorola's MECL 10,000 Series Emitter Coupled Logic"**
(MECL)
Describes some of the characteristics of high digital signal lines and gives wiring rules for MECL 10,000 circuits. Discusses p-c board interconnects, board-to-board interconnects, and wirewrapping techniques.
Motorola AN-556 (22 pg.)

7 **"Using Shift Registers as Pulse Delay Networks"**
(MC10135)
Discusses a high-speed delay shift register using the MC10135 flip flop.
Motorola AN-565 (3 pg.)

8 **"MECL Positive and Negative Logic"**
(MECL)
Describes equivalences between positive and negative ECL logic and provides guides for converting between them.
Motorola AN-567 (2 pg.)

9 **"Testing MECL 10,000 Integrated Logic Circuits"**
(MECL)
Describes AC and DC tests in a 50 ohm transmission-line environment for measuring logic levels or noise margins, circuit current, input currents, propagation delays, edge speeds, and flip-flop toggle rates.
Motorola AN-579 (6 pg.)

High Speed Logic (cont)

10 **"An MSI 500 MHz Frequency Counter Using MECL and MTTL"**
(MECL)
Describes design of 8-digit LED readout counter using MECL III, 10,000 and TTL. Discusses two prescalers using MECL, two input amplifier designs, and a time-base controller for the counter's multiphase clock.
Motorola AN-581 (9 pg.)

11 **"Measure Frequency and Propagation Delay with High Speed MECL Circuits"**
(MECL)
Describes ECL frequency counter useful to 160 MHz and a propagation delay measuring circuit capable of 100-picosecond resolution.
Motorola AN-586 (2 pg.)

12 **"AC Noise Immunity of MECL 10,000 Integrated Circuits"**
(MECL)
Discusses AC noise immunity. Describes test circuits for measuring this immunity and the results to be expected for MECL 10,000 circuits.
Motorola AN-592 (6 pg.)

13 **"Simulate MECL System Interconnections with a Computer Program"**
Develops a basic computer program that allows the user to simulate the performance of signal lines and to analyze termination techniques. Applies to ECL and other high speed digital systems.
Motorola AN-700 (10 pg.)

14 **"Understanding MECL 10,000 DC and AC Data Sheet Specifications"**
(MECL)
Discusses basic MECL 10,000 gate structure, transfer curve and dc levels. Covers specifications data sheet, including power supply drain current, high and low output voltages, propagation delay, rise and fall times, and toggle frequency.
Motorola AN-701 (7 pg.)

15 **"MECL 10,000 Arithmetic Elements MC10179, MC10180, MC10181"**
(MC10179, MC10180, MC10181)
Describes 10180 dual adder/subtractor, 1018 4-bit arithmetic logic unit/function generator, and 10179 lookahead carry block. Discusses their operation in parallel adders, in both ripple and lookahead systems.
Motorola AN-709 (11 pg.)

16 **"Interfacing with MECL 10,000 Integrated Circuits"**
(MC1650, MC1692, MC10115, MC10116, MC10124, MC10125, MC10128, MC10129, MC10216)
Discusses circuits to interface ECL with TTL, TTL and IBM busses, MOS, low level signals, and LEDs.
Motorola AN-720 (9 pg.)

17 **"A High Speed FIFO Memory Using the MECL MC1143 Register File"**
(MCM10143)
Describes the required features of a high speed FIFO design. Different approaches are compared and a design is shown using the MC10143 Multiport Register File.
Motorola AN-730 (6 pg.)

18 **"Bussing with MECL 10,000 Integrated Circuits"**
See listing under (Digital) Data Transmission (Motorola)

©IC MASTER 1979

DIGITAL

High Speed TTL

1 "The MC3000/MC3100 Series Transistor-Transistor Logic Flip-Flops"
(MC3050, MC3051, MC3052, MC3060, MC3061, MC3062, MC3150, MC3151, MC3152, MC3160, MC3162)
Describes basic operation of the various flip-flops available in the MC3000/3100 (54H/79H) series and gives typical operating characteristics of each.
Motorola AN-493 (14 pg.)

2 "Series 54S/74S Schottky TTL Applications"
(SN54S Series, SN74S Series)
Analyzes Schottky clamping techniques and circuits, reviews circuit performance, including discussion of transfer characteristics, switching times, and a-c noise. Discusses power supply considerations, line driving and receiving, noise sources and their abatement. Normalized loading/driving capability information and the pinouts of ICs are discussed.
Texas Instruments Application Report CA-176 (45 pg.)

HNIL/HTL

3 "Noise Immunity with Motorola High Threshold Logic"
(MC660 Series)
Compares noise immunity characteristics between High Threshold Logic (HTL) and standard saturated logic devices. Discusses noise injection and noise reduction techniques.
Motorola AN-298 (5 pg.)

4 "Operation and Application of MHTL I/C Flip-Flops"
(MC663, MC664)
Describes operation and characteristics of the J-K MC663P and the master-slave R-S MC664P flip-flops. Discusses applications as ripple and decade shift counters.
Motorola AN-414 (8 pg.)

5 "Using Motorola High Threshold Logic"
(MC660 Series)
Describes MC660 series ICs and provides many of the characteristics of these units. Application examples include logic translation, line driving, and trigger circuits.
Motorola AN-467 (11 pg.)

6 "Converting Relay Control Systems to Digital I/C's"
(MC660 Series)
Defines and discusses basic Boolean algebra and logic functions and presents method of converting relay diagrams to logic diagrams. Gives examples of conversion method using High Threshold Logic circuits and presents a system design to accomplish this.
Motorola AN-524 (11 pg.)

7 "Design Techniques with HiNIL 367 Quad Schmitt Trigger"
(367)
General discussion of Schmitt Trigger and the differences of the 367, which ignores open inputs and offers 3.5v noise immunity. Applications include line receivers, pulse stretchers, ac detectors, free-running and voltage-controlled oscillators.
Teledyne Semiconductor HiNIL Application, Note 2, (4 pg.)

8 "HiNIL 375 Universal Shift Register"
(375)
Operation and applications of this synchronous 4-bit device as a 4 and 8-bit shift-left, shift-right register, 7 and 8-bit parallel-to-serial and serial-to-parallel converters and various counters.
Teledyne Semiconductor HiNIL Application Note 4 (10 pg.)

HNIL/HTL (cont)

9 "High Noise Immunity Logic — Powerful, Versatile, and Growing"
(300 Series)
Generally describes the HiNIL family use and features. Covers interface to other families, noise immunity, operating considerations and input protection.
Teledyne Semiconductor Digital Application Note 5 (5 pg.)

10 "The HiNIL 347-A Dual Retriggerable One Shot with High Noise Immunity"
(347)
Description and application details for this device are provided along with diagrams showing its use in pulse generators, coincidence detectors, frequency dividers, voltage to frequency and frequency to voltage converters, a pulse absence detector and an ac line presence detector.
Teledyne Semiconductor Digital Application Note 6 (6 pg.)

11 "High Noise Immunity Logic"
(300 Series)
Discussion includes noise immunity, loading rules, fanout, passive pull-up loading, collector or-ing, second level gating, driver pull-up, system interfaces.
Teledyne Semiconductor Digital Catalog (7 pg.)

12 "Combining HNIL and CMOS — An Optimum Design Technique"
See listing under (Digital) Interface (Teledyne Semiconductor)

I^2L

13 "Custom IC Design Using I^2L Technology"
(XR-IIL-CHIP)
Compares I^2L to other technologies. Describes design procedure for linear and digital circuits using master chips.
Exar (5 pg.)

14 "Monolithic I^2L Test Circuit Using XR-C409"
(XR-C409)
A monolithic test circuit has been developed for evaluation of speed and performance capabilities of Exar's (I^2L) technology. This test circuit, designated the XR-C409, is intended to familiarize the I^2L user and the system designer with some of the performance features of I^2L such as its frequency capability and power-speed tradeoffs.
Exar AN-17

Interface

See also Decoders.

15 "Digital Display Systems"
Discusses decoding, format, multiplexing, zero suppression for LED, LCD, incandescent, fluorescent and gas discharge displays.
Fairchild Application Note 212/2 (24 pg.)

16 "9616/9617 EIA Interface Driver and Receiver"
(9616, 9617)
Gives performance characteristics for these devices and describes their use in data communications equipment. Describes EIA standard RS232-C.
Fairchild Application Note 320 (6 pg.)

DIGITAL

Interface (cont)

1 "The Interface Handbook, Line Drivers and Receivers"
(9612, 9613, 9614, 9615, 9616, 9617, 9627, 9634, 9635, 9636, 9637, 9638, 9640, 8T13, 8T14, 8T23, 8T24, 55107, 55108, 55109, 55110, 55121, 55122, 75107, 75108, 75109, 75110, 75112, 75121, 75122, 75123, 75124, 75154, 75207, 75208)
This comprehensive book covers the basics of transmission line theory along with methods for determining signal quality. Major chapters are titled: Data Transmission Lines and their Characteristics; Reflections, Computations and Waveforms; Long Transmission Lines and Data Signal Quality; and Forms of Operation (single/differential, direction of flow, analysis of common interfaces, etc.)
Fairchild Interface Handbook (118 pg.)

2 "ASCII Bus Interface Logic Uses IM5200 FPLA"
(IM5200)
Explains ASCII interface bus and how IM5200 provides discrete logic and address storage required by it.
Intersil Application Bulletin MB002 (6 pg.)

3 "Semiconductors for Plated-Wire Memories"
(MC4006, MC4007, MC4038, MC4040, MC4043, MC1514, MC1546)
Discusses operation and electrical characteristics of plated wire memories. Covers applications of drivers, sense amplifiers, and decoders as interface circuits. Also discusses memory organization and memory-related semiconductor applications.
Motorola AN-533 (15 pg.)

4 "Interface Techniques Between Industrial Logic and Power Devices"
Presents worst case design approaches to illustrate methods of interfacing McMOS and MHTL logic to various ac and dc power load levels.
Motorola AN-712A (19 pg.)

5 "Interface Considerations for Numeric Display Systems"
(MC14511, MC14543)
Gives basic information on LCD, LED, gas discharge, fluorescent and incandescent displays. Discusses interfacing 7 segment displays to logic with emphasis on multiplexed systems.
Motorola AN-741 (25 pg.)

6 "Interfacing with MECL 10,000 Integrated Circuits"
See listing under (Digital) High Speed Logic (Motorola)

7 "MM54C/MM74C Voltage Translation/Buffering"
(MM54C901, MM54C902, MM54C903, MM54C904, MM74C901, MM74C902, MM74C903, MM774C904)
Interfacing PMOS to CMOS, CMOS to CMOS with different voltage levels, and CMOS to two standard TTL loads, are illustrated using 74C901 series devices.
National MB-18 (2 pg.)

8 "Driving 7-Segment LED Displays with National Semiconductor Circuits"
(DM5446A, DM5447A, DM5448A, DM7446A, DM7447A, DS75491, DS75492, DS7856, DS7858, DS8856, DS8857, DS8858, DS8861, DS8863, DS8864, DS8865, DS8866)
Discusses configurations and construction of 7-segment LEDs and drive modes. Describes BCD to 7-segment decoder drivers, BCD to 7-segment LED drivers, MOS to LED segment drivers, four and five segment drivers, as well as digit drivers. Describes calculator and digital clock applications.
National AN-99 (12 pg.)

9 "Using the MM5704 Keyboard Interface in Keyboard Systems"
See listing under (Digital) Encoders (National)

Interface (cont)

10 "TTL/MOS/DTL Interfaces"
Techniques for coupling the above devices and characteristics of the interfaces.
National MB-7 (2 pg.)

11 "COS/MOS Interfacing Simplified"
(CD4000 Series)
Covers interfacing 4000A and B series with TTL, DTL, ECL, NMOS, PMOS, industrial and power control circuits, op amps and displays.
RCA ICAN-6315 (7 pg.)

12 "Applications of the RCA CD4093B COS/MOS Schmitt Trigger"
See listing under (Digital) CMOS (RCA)

13 "Interfacing COS/MOS with Other Logic Families"
See listing under (Digital) CMOS (RCA)

14 "Interfacing with CMOS"
See listing under (Digital) CMOS (Solid State Scientific)

15 "Completely Monolithic IC Series for Gas Discharge Display Interface"
(UDN-6144, UDN-6164, UDN-6184, UDN-7183, UDN-7184, UDN-7186)
Describes operation of high voltage IC's to drive the digits and segments of 200v (Panaplex) gas discharge displays.
Sprague Electric Microcircuit Application Report MAR75-1 (8 pg.)

16 "Expanding the Frontiers of IC Interface for Electronic Displays"
Presents interface IC basics concerning incandescent, gas discharge, LED, plasma, fluorescent, and hot wire displays.
Sprague Electric (10 pg.)

17 "Using Bipolar Logic to Improve Performance in CMOS and Microprocessor Systems"
Suggests the use of HiNIL for improving noise performance, input protection, and output drive, and of LP Schottky for improved speed/power.
Teledyne Semiconductor Digital Application Note 7 (4 pg.)

18 "Combining HNIL and CMOS — An Optimum Design Technique"
(300 Series)
Discusses noise immunity, HNIL/74C interface, Schmitt trigger input and high current output.
Teledyne Semiconductor Digital Catalog (3 pg.)

19 "TTL to MOS and MOS to TTL Interface Circuits"
(SN7400, SN75107, SN75207, SN75270, SN75370, SN75450, SN75451, TMS1103, TMS4062)
Describes MOS/TTL interface circuits using bipolar transistors, JFETs, MOSFETs, and ICs.
Texas Instruments Application Report CA-170 (11 pg.)

LSI, General

20 "Semi-Custom LSI Design with I^2L Gate Arrays Using XR300 and XR500"
A design approach to developing complex LSI systems using the devices is described.
Exar AN-16

©IC MASTER 1979

LSI, General (cont)

1 **"Design of Custom LSI Circuitry for Modern Digital Systems"**
Discusses design of LSI devices. Covers size considerations, numbers of input/output connections, number of output drivers, use of repetitive patterns, use of computer aided design techniques, speed versus size and power, and interfacing.
General Instrument Microelectronics (7 pg.)

Multiplexers

2 **"TTL MSI Multiplexers and Demultiplexers"**
(DM7210, DM7842, DM8210, DM8842)
Describes features of DM7210 multiplexer and DM7842 demultiplexer and discusses their use in a synchronous digital data transmission system, a keyboard entry decoder, and as minterm generators.
National AN-37 (8 pg.)

PLAs

3 **"How to Design with Programmable Logic Arrays"**
(DM8575, DM8576)
Discusses operation of PLAs and use as code converters, decode elements in digital processors and sequential controllers.
National AN-89 (8 pg.)

4 **"Single Chip Multiprocessor Arbiter"**
Shows how the Field Programmable Logic Sequencer (FPLS) can use state logic to implement a multiprocessor arbiter conveniently and cost effectively.
Signetics (4 pg.)

5 **"FPLA Adds Display Flexibility to CRT Controllers"**
(6845)
Describes how field programmable logic arrays can adapt the 6845 CRT controller to display different foreign formats.
Signetics (6 pg.)

6 **"Field Programmable Logic Arrays — An Application Manual"**
Covers basic FPLA operation and describes various applications, including a data cartridge tape drive controller, an op-code decoder for the PDP-11, and a combination sync and video generator.
Signetics (116 pg.)

7 **"MOS Programmable Logic Arrays"**
(TMS2000 Series, TMS2200 Series)
Describes TMS2000 and TMS2200 Series programmable logic arrays. Describes their internal logic and operations. Provides ordering instructions.
Texas Instruments Application Report CA-158 (13 pg.)

Pulse Handling

8 **"Nanosecond Pulse Handling Techniques in I/C Interconnections"**
Discusses problems of pulse transmission and measurement for TEM mode on coax, stripline, and above-ground wire systems.
Motorola AN-270 (6 pg.)

Trigger Circuits

9 **"Advantages of the AM26123 Compared with the AM54/74123"**
(AM26123, SN54123, SN74123)
Discusses changes in the pulse width circuits and the addition of on output latch.
Advanced Micro Devices Application Brief (4 pg.)

10 **"CMOS Schmitt Triggers"**
(MC14093B, MC14583B, MC14584B)
Operating characteristics, theory of operation, and Schmitt trigger applications are covered for digital logic systems.
Motorola AN-768 (8 pg.)

11 **"1.3 Volt IC Flasher, Oscillator, Trigger, or Alarm"**
See listing under (Linear) Timers (National)

12 **"Series ULN-3300M Schmitt Trigger Integrated Circuits — Typical Applications and Operation"**
(ULN-3303, ULN-3304, ULN-3305, ULN-3306)
Describes device and use in multivibrators, switches, timers, and more.
Sprague AN-27450.19

13 **"CMOS Schmitt Trigger — a Uniquely Versatile Design Component"**
(MM54C14, MM74C14)
Analyzes CMOS Schmitt triggers and outlines applications including a light activated switch, an RC oscillator, and a pulse stretcher. Also outlines the benefits of hysteresis.
National AN-140 (6 pg.)

14 **"Designing with SN54/SN74LS123"**
(SN54LS123, SN74LS123)
Describes use of this multivibrator in various applications including a missing pulse detector, a low pulse generator, and a pulse width detector.
Texas Instruments Application Report CA-196 (11 pg.)

TTL, General

15 **"Medium Scale Integration in the Numerical Control Field"**
(MC4016, MC4018, MC4024, MC4044, MC4324, MC4344)
Discusses operation of MC4016 decade programmable cascadeable counter, MC4324/4024 dual voltage controlled multivibrator, and MC4344/4044 frequency phase detector. Describes applications of these devices in audio frequency comparator, frequency synthesizer, and motor speed control circuits.
Motorola AN-541 (10 pg.)

16 **"TTL Integrated Circuits — Applications of MSI Devices"**
Covers counters, modulo-N dividers, decoders, switches, adders, comparators, parity generators, shift registers and bus-ORable flip-flop. Describes many applications, including up/down counters, a stepping waveform generator, shift registers, frequency synthesizers, digital data demultiplexer, analog commutator, minterm generator, ripple carry parallel adder and tape position locator.
National AN-36 (23 pg.)

17 **"Tri-State Logic in Modular Systems"**
(DS7831, DM8093, DM8094, DM8214, DM8230, DM8551, DM8552, DM8598, DS8831, DM8840, DM8842, DM8846)
Discusses output drive characteristics, logical control, safety factors in Tri-State Logic circuits. Describes applications, including complex switching functions, driving and transmitting, multiplexing, data storage, decoding, and data manipulation.
National AN-43 (16 pg.)

DIGITAL

TTL, General (cont)

1 **"Characteristics and Applications of Tri-State IC's"**
(DM7093, DM7490, DM7214, DM7230, DM7551, DM7598, DS7831, DS8831)
Describes application of the general configuration of the Tri-State logic family and discusses application of the following: quad bus-buffer gates, dual 4:1 multiplexer, demultiplexer and bus-interchange switch, quad-D flip-flop, expandable 256-bit ROM, and quad driver.
National AN-45 (12 pg.)

2 **"Tri-State Logic in High Speed Memories of Microprogrammed Computers"**
(DM8551)
Discusses tri-state logic in general and its use in scratchpad memories. Covers storage of microinstructions and program constants in high-speed ROMs.
National AN-47 (5 pg.)

3 **"Tri-State Logic Applied in a Computer System Can Reduce System Cost and Provide Added Performance"**
(DM8556)
Analyzes Tri-State characteristics using the DM8556 counter/register as an example. Shows how performance of PDP-8 can be improved using TSL.
National AN-73 (7 pg.)

LINEAR

Active Filters

4 **"Function Circuits, Design and Applications"**
See listing under (Linear) General (Burr-Brown)

5 **"Active Filter Design with IC OP Amps"**
(XR3403, XR4136, XR4202, XR4558)
Provides table of transfer functions and equations for low, high and bandpass filters as well as filter responses for Bessel, Butterworth and Chebychev types. Working schematic of an active filter in a modem application included.
Exar AN-03 (8 pg.)

6 **"Designing Active Filters with Universal Filter Building Blocks"**
(ACF7032, ACF7092)
Provides users with the data necessary to design filters with low pass, high pass, and band reject magnitude frequency responses using the device. Contains basic theory as well as table of parameters.
General Instrument Bulletin 0703 (8 pg.)

7 **"The Effect of Operational Amplifier Performance Limitations on State-Variable Active Filters"**
(ACF7092)
Derives simplified expressions which predict second-order effects for a state-variable filter. For verification, the formula is applied to a commercially available hybrid IC active filter.
General Instrument Bulletin 0704 (4 pg.)

8 **"Design of a Hybrid Integrated Circuit Elliptic Active RC Filter"**
Discusses design details and experimental results obtained in building hybrid IC sharp rolloff filters.
General Instrument Bulletin 0705 (4 pg.)

9 **"High Q Notch Filter"**
(LM102, LM202, LM302)
Describes use of LM102 connected to a twin "T" network to form a high Q, 60 Hz notch filter.
National Linear Applications Handbook, Vol. I LB-5 (2 pg.)

Amplifiers, Current

10 **"Application of the LH0002 Current Amplifier"**
(LH0002)
Circuit operation. Describes uses in a differential input-output op amp, booster amplifier, level shifter, pulse transformer driver, and transmission line driver.
National AN-13 (4 pg.)

Amplifiers, Instrumentation

11 **"AD520 Monolithic Instrumentation Amplifier"**
(AD520)
Describes performance of this instrumentation amplifier. Covers application as a bridge amplifier, ground loop eliminator, and floating measurement amp. Appendix compares instrumentations amplifier to several multiple op amp circuits.
Analog Devices (6 pg.)

12 **"A User's Guide to IC Instrumentation Amplifiers"**
(AD522)
Explains where and when an instrumentation amplifier may best be employed. Provides basic theory, specifications and examples of use.
Analog Devices (12 pg.)

©IC MASTER 1979

LINEAR

Amplifiers, Instrumentation (cont)

1 **"Instrumentation Amplifiers — Versatile Differential Input Gain Blocks"**
(3660, 3670)
Describes the features and general operation of instrumentation amplifiers. Depicts their use in bridge circuits, in reducing ground loop interference, and in driven guard input circuits.
Burr-Brown AN-75 (6 pg.)

2 **"Optical Coupling Extends Isolation-Amplifier Utility"**
(3450, 3650)
Explains isolation amplifier fundamentals, optical coupling, and use of the amp in medical electronics and industrial motor control.
Burr-Brown AN-85 (8 pg.)

3 **"Instrumentational Amplifiers"**
(LM114, LM118)
Discusses general purpose instrumentation amplifier, using LM114 matched transistors ahead of an LM118 op amp that is optimized for wide bandwidth.
National Linear Application Handbook, Vol. II, LB-21 (2 pg.)

4 **"Instrumentation Amplifier"**
(LM101A, LM102, LM107)
Describes a differential-input instrumentation amplifier using LM102 and LM107 and variable gain version that also uses LM101A.
National Linear Applications Handbook, Vol. I LB-2 (2 pg.)

5 **"OP-10 Instrumentation Amplifier CMRR Versus Frequency Improvement"**
(OP-10)
Discusses optimization of CMRR versus frequency response of a three op amp instrumentation amplifier.
Precision Monolithics AB-2 (1 pg.)

6 **"Application of the RCA CA3000 Integrated-Circuit DC Amplifier"**
(CA3000)
Describes circuit and application as modulated oscillator, crystal oscillator, low-frequency mixer, cascaded RC-coupled feedback amp, narrow-band tuned amp, and Schmitt trigger.
RCA ICAN-5030 (11 pg.)

7 **"The Instrumentation Amp vs the Op Amp: Which, Where, and How to Use Them"**
Compares an op amp connected as a differential amp with an instrumentation amp built from several general purpose op amps. Discusses how to put each one together, and when and where to use them.
Teledyne Philbrick AN-29 (6 pg.)

Amplifiers, Operational

8 **"An IC Amplifier User's Guide to Decoupling, Grounding, and Making Things Go Right for a Change"**
Contains considerable information on good grounding practices and op amp decoupling.
Analog Devices Application Note (8 pg.)

9 **"Applying the AD504 Precision IC Operational Amplifier"**
(AD504)
Describes this amplifier and offers notes on its noise, thermal and dynamic performance. Applications: instrumentation amplifier, stable reference regulator, instrument input amplifier and high gain ac amplifier.
Analog Devices Technical Bulletin (7 pg.)

Amplifiers, Operational (cont)

10 **"Protect Op Amps from Overloads"**
Discusses protection from power-supply faults, keeping input voltages at safe levels, and limiting output currents.
Burr-Brown AN-60 (3 pg.)

11 **"Combine Two Op Amps to Avoid the Speed Accuracy Compromise"**
(3521)
Discusses interconnecting low drift and wideband op amps to form a composite op amp.
Burr-Brown AN-64 (2 pg.)

12 **"Check Five Op Amp Specs in One Test"**
Describes a test circuit that generates signals providing measurements of open loop gain, offset voltage, input bias current, quiescent current, and output voltage swing.
Burr-Brown AN-65 (1 pg.)

13 **"Using Op Amps in Low Noise Applications"**
Discusses shot noise and noise from source resistances.
Burr-Brown AN-68 (2 pg.)

14 **"Design of a Unique Precision Controlled Current Source"**
(3500)
Diagrams a current source using an op amp and a complementary FET pair to form a current source with differential input and bipolar current output.
Burr-Brown AN-74 (2 pg.)

15 **"Designing with Operational Amplifiers: Application Alternatives"**
Amplifier improvement techniques, signal analyzers, signal conditioners, absolute value circuits, signal generators, computing circuits, data transmission circuits, as well as test and measurement circuits are discussed. Circuit designs and explanations of circuit operation are provided.
Burr-Brown $17.50 (220 pg.)

16 **"Operational Amplifiers — Design and Application"**
Covers basic theory, amplifier design techniques and applications.
Burr-Brown $24.50 (470 pg.)

17 **"Applications of Operational Amplifiers"**
Presents op amp applications including designs for signed controls, processors, waveform generators, and special purpose circuits. Provides information on error sources, circuit values, and design equations.
Burr-Brown $19.50 (220 pg.)

18 **"Frequency Compensation Techniques for an Integrated Operational Amplifier"**
(μA702A)
Presents design techniques for frequency compensation of μA702A which are applicable to other IC operational amplifiers.
Fairchild Application Bulletin 117/2 (8 pg.)

19 **"The μA739 — A Low-Noise Dual Operational Amplifier"**
(μA739)
Describes the circuit and operating characteristics. Covers d-c circuit performance, low-frequency analysis, power consumption, noise, short-circuit protection, amplifier isolation, and compensation techniques.
Fairchild Application Note 175/1 (8 pg.)

Amplifiers, Operational (cont)

1 **"The μA776, an Operational Amplifier with Programmable Gain, Bandwidth, Slew-Rate, and Power Dissipation"**
(μA776)
Describes methods for setting the master bias current, discusses amplifier frequency response as a function of this current. Discusses applications, including a 600 nanowatt amplifier, a low-cost sample and hold circuit, a current controlled oscillator, multiplexing, and phase shifting.
Fairchild Application Note 218 (5 pg.)

2 **"A Low Drift, Low Noise Monolithic Operational Amplifier for Low Level Signal Processing"**
(μA725)
Describes operation of μA725, which offers low offset drifts, low input currents, low noise performance, and massive open loop gain. Shows how to minimize offset voltage drift with temperature in IC operational amplifiers and how to improve the common-mode rejection.
Fairchild Application Note 277 (10 pg.)

3 **"The μA715 — A Versatile High Speed Operational Amplifier"**
(μA715)
Describes application as an image orthicon head amplifier, general purpose video amplifier, 40dB high input impedance amplifier, and high speed sample and hold circuit.
Fairchild Application Note 265 (4 pg.)

4 **"Applications of the μA749 Dual Operational Amplifier"**
(μA749)
Describes applications as a dual level comparator, positive or negative peak detector, peak-to-peak detector, and as an offset null circuit.
Fairchild Application Note 268 (2 pg.)

5 **"The μA749 Dual Operational Amplifier"**
(μA749)
Discusses the circuit, input voltage range, latch-up, output voltage range, power dissipation, noise, separation, high frequency compensation, and output capability.
Fairchild Application Note 269 (8 pg.)

6 **"Applications of the μA741 Operational Amplifier"**
(μA741)
Describes applications of this amplifier as a unity gain voltage follower, integrator, differentiator, voltage regulator reference amplifier, high voltage regulated power supply control element, clipping amplifier, and a comparator.
Fairchild Application Note 289/1 (4 pg.)

7 **"An Improved Sample and Hold Circuit Using the μA740"**
(μA740)
Basic discussion of acquisition and hold times. Description of circuit using this op amp as the buffer amplifier.
Fairchild Application Note 297 (3 pg.)

8 **"Applications of the μA777"**
(μA777)
Discusses use of this operational amplifier as a pulse amplifier, Wein Bridge oscillator, variable gain differential amplifier, power amplifier.
Fairchild Application Note 300 (3 pg.)

9 **"Radiation Testing of Linear Microcircuits"**
See listing under (Linear) General (Fairchild)

Amplifiers, Operational (cont)

10 **"Operational Amplifiers as Inductors"**
(μA777)
Includes derivation of equivalent circuit and necessary component values to obtain inductances from millihenries to kilohenries, using the μA777 as an example. Describes application in voltage controlled sinewave oscillators and in bandpass and notch filters.
Fairchild Application Note 321 (5 pg.)

11 **"Applications of the Gated Linear Amplifier ZN424"**
(ZN424)
Details the operation of the ZN424 and describes a variety of specific applications including filters, comparators, and peak hold circuits.
Ferranti (46 pg.)

12 **"HA-909 Operational Amplifier"**
(HA-909, HA-911)
Discusses applications as a unity gain breadboard op amp, servo preamplifier, high-Q bandpass filter, Wien bridge oscillator, and phase-delay filters.
Harris Application Note 501 (2 pg.)

13 **"HA-909 Operational Amplifiers Performance Tailoring"**
(HA-909, HA-911)
Discusses how to optimize HA-909's offset, power dissipation, bandwidth, large signal bandwidth, slew rate, transient response, and stability with reactive loads.
Harris Application Note 502 (3 pg.)

14 **"A High Impedance Hysteresis Circuit"**
(HA-2520, HA-2620)
Describes HA-2520/HA-2620 used as a hysteresis amplifier and covers output voltage limiting.
Harris Application Note 505 (2 pg.)

15 **"Test Procedures for Operational Amplifiers"**
Circuit for measuring offset voltage, bias current, offset current, open loop voltage gain, common mode and power supply rejection ratios, output voltage/current, power dissipation, and making continuity checks.
Harris Application Note 508 (2 pg.)

16 **"A Simple Comparator Using the HA-2620"**
(HA-2620)
Describes op amp comparator circuit capable of driving approximately ten logic gates.
Harris Application Note 509 (1 pg.)

17 **"A Simple Square-Triangle Waveform Generator"**
(HA-2510, HA-2600, HA-2620)
Circuit for waveform generator using three op amps.
Harris Application Note 510 (2 pg.)

18 **"The HA-2400 PRAM Four Channel Operational Amplifier"**
(HA-2400, HA-2405)
This is a programmable input stage, operational amplifier. This note describes its applications including an analog multiplexer with buffered input and output, an inverting or non inverting amplifier with a programmable gain, a sine wave oscillator with programmable frequency, and a track and hold/sample and hold circuit.
Harris Application Note 514 (8 pg.)

19 **"Operational Amplifier Stability: Input Capacitance Considerations"**
(HA-2600, HA-2605)
Discusses overcoming stray capacitance in op amps, such as the HA-2600.
Harris Application Note 515 (2 pg.)

©IC MASTER 1979

LINEAR

Amplifiers, Operational (cont)

1 **"The HA-2530/2535 Wideband High Slew Inverting Amplifier"**
(HA-2530, HA-2535)
Briefly discusses internal circuit. Shows how closed-loop frequency response can be predicted. Describes application as a fast settling coaxial driver, a 10 MHz coaxial line driver, a wide range signal separator, a high frequency triangular wave generator, and a current-to-voltage converter.
Harris Application Note 516 (11 pg.)

2 **"Applications of a Monolithic Sample-and-Hold/Gated Operational Amplifier"**
(HA-2420, HA-2425)
Describes HA-2420/2425 circuit. Applications include various track-and-hold/sample-and-hold configurations, an A/D converter, a demultiplexer, an integrated-hold-reset amplifier, a gated operational amplifier, and a peak detector with reset.
Harris Application Note 517 (8 pg.)

3 **"The HA-2900 Monolithic Chopper Stabilized Amplifier"**
(HA-2900)
Discusses offset voltage and current drift and chopper stabilization, then describes the circuit. Applications include a high impedance differential instrumentation amplifier, use as an integrator, and several wide bandwidth configurations.
Harris Application Note 518 (8 pg.)

4 **"Operational Amplifier Noise Prediction"**
Provides a noise model, a procedure for computing output noise, and spot noise curves for many Harris amplifiers.
Harris Semiconductor AN-519 (10 pg.)

5 **"Precision Op Amp on a Semicustom Chip"**
(MONOCHIP)
Discusses building an op amp on a semicustom chip with performance comparable to standard precision units. Covers all phases of design and thermal considerations as well.
Interdesign APN-9 (10 pg.)

6 **"The 8007 — A High Performance FET-Input Operational Amplifier"**
(ICL8007)
Circuit description, applications as log and antilog amplifiers, photocell amplifier, peak detector, sample and hold circuits, high impedance buffer, and Wien Bridge oscillator.
Intersil Application Bulletin A005 (6 pg.)

7 **"The 8043 — A Low Cost Dual FET-Input Operational Amplifier"**
(ICL8043)
Summary of circuit characteristics. Applications as automatic offset suppression circuit, staircase generation, sample and hold circuit, and instrumentation amplifier.
Intersil application Bulletin A008 (6 pg.)

8 **"Power Op-Amp Heat Sink Kit"**
(ICH8510, ICH8520, ICH8530)
Discusses mounting the devices on heat sinks.
Intersil Application Bulletin A029 (2 pg.)

9 **"Getting More Value Out of an Integrated Operational Amplifier Data Sheet"**
Discusses the open loop characteristics of operational amplifiers and their relation to overall circuit operation. Defines parameters and describes their significance with respect to closed loop considerations as well.
Motorola AN-273A (10 pg.)

Amplifiers, Operational (cont)

10 **"D.C. Servo Motor Systems Using the ICH8510"**
See listing under (Linear) Amplifiers, Power (Intersil)

11 **"The MC1535 Monolithic Dual Operational Amplifier"**
(MC1435, MC1535)
Gives complete ac and dc circuit analysis and discusses electrical characteristics. Discusses applications in a differential input-differential output circuit configuration, and as a signal envelope detector. Describes an input compensation scheme for fast slew rate.
Motorola AN-41 (9 pg.)

12 **"The MC1539 Operational Amplifier and its Applications"**
(MC1439, MC1539)
Discusses dc and ac operation and the performance of this amplifier. Describes a high frequency feed-forward scheme and application as a comparator, voltage follower, differential amplifier, and a summing amplifier.
Motorola AN-439 (22 pg.)

13 **"The MC1556 Operational Amplifier and its Applications"**
(MC1456, MC1556)
Gives characteristics and describes operation. Discusses application as a voltage follower, high impedance bridge amplifier, and a logarithmic amplifier.
Motorola AN-522 (8 pg.)

14 **"Analysis and Design of the Op/Amp Current Source"**
Develops expressions for the transfer function and output impedance of voltage controlled op amp current source using both ideal and non-ideal models. Discusses effects of parameter and temperature variations on performance.
Motorola AN-587 (7 pg.)

15 **"Drift Compensation Techniques for Integrated DC Amplifiers"**
Op amp bias current and offset voltage compensation are discussed. Current compensation techniques for high impedance levels and methods to achieve chopper-stabilized drift performance at low impedance levels are covered.
National Linear Applications Handbook, Vol. I, AN-3 (4 pg.)

16 **"Monolithic Operational Amplifiers — The Universal Linear Component"**
(LM101, LM102)
Applications of the LM101 and, in some cases, the LM102, include free-running multivibrator, level shifting amplifier, voltage comparator, servo preamplifier, and computing circuits. Frequency compensation techniques are discussed in detail.
National Linear Applications Handbook, Vol. I, AN-4 (10 pg.)

17 **"Low Power Operational LH0001 Amplifier"**
(LH0001)
Operation of circuit offering 0.2 mv typical offset voltage at 25°C and quiescent supply currents in 100 μA range.
National Linear Applications Handbook, Vol. I, AN-10 (4 pg.)

18 **"Noise Specs Confusing?"**
Explanation of terms and factors contributing to noise, calculation of noise figure and signal to noise ratio. Gives points on selecting low noise amplifiers.
National AN-104 (8 pg.)

19 **"An Applications Guide for Operational Amplifiers"**
(LH101, LH201, LM101, LM201, LM301)
Discusses application of operational amplifiers, grouping them in five categories: simple amplifiers, operational circuits, transducer amplifiers, wave shapers and generators, and power supplies.
National AN-20 (12 pg.)

LINEAR

Amplifiers, Operational (cont)

1 "A Simplified Test Set for Operational Amplifier Characterization"
(LM101, LM201, LM301, LM709)
Gives a functional description of set that allows quantitative characterization of the dc operational amplifier parameters for the LM101 and LM709. Discusses the circuit, includes construction information, and gives a layout for the tester circuit boards.
National AN-24 (12 pg.)

2 "IC Op Amp Beats FETs on Input Current"
(LM108, LM208, LM308)
Describes LM108 operation and performance. Applications: sample and hold circuit, integrator, sine wave oscillator, capacitance multiplier, instrumentation amplifier, logarithmic converter, transducer amplifier, current source and voltage comparator. Discusses PC board construction.
National Linear Applications Handbook, Vol. I, AN-29 (20 pg.)

3 "Logarithmic Converters"
(LM101A, LM102, LM108)
Describes log generators, anti-log generators, cube generators, and multiplier/dividers, using the LM101A and LM108 op amps.
National Linear Applications Handbook, Vol. I, AN-30 (4 pg.)

4 "Op Amp Circuit Collection"
(LM101A, LM102, LM107, LM108)
Gives schematics only for some 90 circuits using one or more of the following operational amplifiers: LM101A, LM102, LM107, LM108. Includes basic, signal generation and signal processing circuits.
National Linear Applications Handbook, Vol. I, AN-31 (20 pg.)

5 "New Design Techniques for FET Op Amps"
(LH0022, LH0022C, LH0042C, LH0052, LH0052C)
Gives parameters for LH0022, LH0042 and LH0052 operational amplifiers. Discusses rationale for FETs in these devices, describes the circuits. Describes application as voltage followers, integrators, sample/hold amplifiers, comparators, instrumentation and charge amplifiers.
National Linear Applications Handbook, Vol. I, AN-63 (12 pg.)

6 "Micropower Circuits Using the LM4250 Programmable Op Amp"
(LM4250, LM4250C)
Describes LM4250 circuit and bias current setting procedure. Applications: 500 nano-watt amplifier, micro-power comparator meter amplifier, pulse generator, instrumentation amplifier and a 5v regulator for CMOS logic circuits.
National AN-71 (8 pg.)

7 "The LM3900 — A New Current-Differencing Quad of ±Input Amplifiers"
(LM3900)
Describes Norton "current mirror" circuit. Emphasizes the amplifiers' application in circuits for single power supply systems. Discusses use in ac and dc amplifiers, voltage regulators, RC active filters, waveform generators, phase locked loops, and voltage controlled oscillators.
Also covers designing digital and switching circuits, and special applications, including tachometers, squaring amplifiers, positive feedback oscillators, line operated audio amplifiers, and power circuits.
National AN-72 (39 pg.)

Amplifiers, Operational (cont)

8 "Applications for a High Speed FET Input Op Amp"
(LH0062, LH0062C)
Describes circuit, performance, compensation techniques for LH0062. Discusses applications in high speed sample and hold circuit, high speed peak detector, programmable integrator, and wide band ac voltmeter. Covers heat sinking, guarding, and bootstrapping.
National AN-75 (4 pg.)

9 "Use the LM158/LM358 Dual, Single Supply Op Amp"
(LM158, LM258, LM358)
Proposes using this dual op amp with a single supply in place of the MC1458/MC1558 with a split supply.
National AN-116 (4 pg.)

10 "LM143 Monolithic High Voltage Operational Amplifier Applications"
(LM143, LM243, LM343)
Describes circuit. High voltage applications: 130v p-p drive, ±34 CMV instrumentation amplifier, high compliance current source. Current boosted applications: 100 ma, 1 amp, high compliance. 90 W audio amplifier. High voltage power supplies. Also application tips.
National AN-127 (12 pg.)

11 "A Linear Multiple Gain-Controlled Amplifier"
Discusses gain control with FETs in the feedback path of an operational amplifier. Considers remote or multichannel gain control, volume expansion, and volume compression/limiting as possible applications.
National AN-129 (8 pg.)

12 "A Linear Multiple Gain Controlled Amplifier"
Portrays a linear control function with over three decades of gain achieved with a FET in the feedback path of a non-inverting amplifier. Gain control with FETs, distortion, bandwidth, and the control time constant are other subjects touched upon.
National FET Databook (8 pg.)

13 "Binary/BCD Gain Programmed Amplifiers"
Illustrates construction of a gain programmed amplifier using an FET quad current mode switch, 4 binary weighted resistors, and an op amp.
National FET Databook (3 pg.)

14 "The Monolithic Op Amp: A Tutorial Study"
Detailed paper on the design of IC operational amplifiers.
National Linear Applications Handbook, Vol. II (18 pg.)

15 "Feedforward Compensation Speeds Op Amp"
(LM101A, LM201A, LM301A)
Compares standard frequency compensation with feedforward frequency compensation of LM101A. Charts open loop response for both compensation networks. Shows fast integrator circuit.
National Linear Applications Handbook, Vol. I, LB-2 (2 pg.)

16 "Fast Compensation Extends Power Bandwidth"
(LM101A, LM201A, LM301A)
Describes frequency compensation technique that extends power bandwidth of LM101A for non-inverting gains of unity to ten and also reduces gain error at moderate frequencies.
National Linear Applications Handbook, Vol. I, LB-4 (2 pg.)

17 "Precision AC/DC Converters"
(LM101A, LM201A, LM301A)
Describes the use of the LM101A in a circuit for eliminating diode threshold potential, use as a precision clamp, as a fast half wave rectifier, and precision AC to DC converter.
National Linear Applications Handbook, Vol. I, LB-8 (2 pg.)

©IC MASTER 1979

LINEAR

Amplifiers, Operational (cont)

1 **"Universal Balancing Techniques"**
Describes offset voltage adjustment: for inverting amplifiers using less than 10 K source resistance or using any type of feedback element, for non-inverting amplifiers, for voltage followers, and for differential amplifiers.
National Linear Applications Handbook, Vol. I, LB-9 (2 pg.)

2 **"Speed Up the LM108 with Feedforward Compensation"**
(LM108, LM208, LM308)
Describes simple feedforward network for use with LM108 to achieve a factor of five improvement in speed.
National Linear Applications Handbook, Vol. I, LB-14 (2 pg.)

3 **"Easily Tuned Sine Wave Oscillators"**
(LM101A, LM111, LM201A, LM211, LM301A, LM311)
Describes a circuit using the LM101A and LM111 that provides both a sine and square wave output for frequencies for below 20 Hz to above 20 KHz. Also describes low distortion sine wave oscillator using two LM101As.
National Linear Applications Handbook, Vol. I, LB-16 (2 pg.)

4 **"Predicting Op Amp Slew Rate Limited Response"**
Discusses slew rate limiting and gives curves for sine wave and step voltage response.
National Linear Applications Handbook, Vol. I, LB-19 (2 pg.)

5 **"Low Drift Amplifiers"**
(LM121, LM725, LM741, LM308)
Discusses problems causing drift in amplifiers and recommends solutions. Includes discussion of thermal and electrical shielding, resistor choice, circuit layout, and offset balancing.
National Linear Application Handbook, Vol. II, LB-22 (2 pg.)

6 **"True RMS Detector"**
Describes circuit using operational amplifiers that provide dc output equal to rms value of input with 2% accuracy for a 20 $V_{p\text{-}p}$ input signal from 50 Hz to 100 kHz.
National Linear Applications Handbook, Vol. II, LB-25 (2 pg.)

7 **"Low Current Ammeter"**
(LM216A)
Depicts construction of an ammeter using the LM216A op amp.
National LB-37 (2 pg.)

8 **"Specifying Selected Op Amps and Comparators"**
See listing under (Linear) Comparators (National)

9 **"IC Preamp Challenges Choppers On Drift"**
See listing under (Linear) Pre-amplifiers (National)

10 **"Digital Nulling of OP-05 and SSS725"**
(DAC-08, OP-05, SSS725)
Shows digitally controlled offset nulling achieved by imbalancing the first stage collector currents of the op amp with a D/A.
Precision Monolithics AB-3 (1 pg.)

11 **"Simple Precision Millivolt Reference Uses No Zeners"**
(OP-05)
Describes −3.5 mv to 3.5 mv reference built with instrumentation op amp and a potentiometer.
Precision Monolithics AN-10 (1 pg.)

Amplifiers, Operational (cont)

12 **"The OP-07 Ultra-Low Offset Voltage Op Amp — A Bipolar Op Amp that Challenges Choppers, Eliminates Nulling"**
(OP-07)
Describes circuit design, compares performance to other devices. Covers application in a voltage reference, a high accuracy buffer, a D/A test system, a composite summing amplifier, an absolute value circuit, an analog computer building block, and as a thermocouple amplifier.
Precision Monolithics AN-13 (12 pg.)

13 **"Minimization of Noise in Operational Amplifier Applications"**
(OP-07)
Describes internal and external sources of noise. Helps to locate noise sources by frequency. Gives examples of noise calculation using the OP-07 as an example.
Precision Monolithics AN-15 (11 pg.)

14 **"The OP-17, OP-16, OP-15 as Output Amplifiers for High Speed D/A Converters"**
(DAC-08, DAC-20, DAC-76, OP-15, OP-16, OP-17)
Illustrates design of high speed, voltage output D/A converters using these devices. Circuit diagrams for high speed, low drift, and low power applications are provided.
Precision Monolithics AN-24 (3 pg.)

15 **"Applications of the RCA CA3048 Integrated Circuit Amplifier Array"**
(CA3048)
Discusses operating parameters for this 4-amplifier array and covers applications, including Hartley and Colpitts oscillators, an astable multivibrator, four-channel linear mix, and a gain-controlled amplifier.
RCA ICAN-4072 (8 pg.)

16 **"Application of the RCA CA3008 and CA3010 Integrated-Circuit Operational Amplifiers"**
(CA3008, CA3010)
Describes operating characteristics of two op amps and their application in video amplifiers, frequency-shaping amplifiers, comparators, integrators, differentiators, scaling adders. Also covers the addition of a power output stage and/or input emitter followers.
RCA ICAN-5015 (15 pg.)

17 **"Application of the RCA CA3015 and CA3016 Integrated-Circuit Operational Amplifiers"**
(CA3015, CA3016)
Describes operating characteristics at ±12 v. Applications covered are: 50-dB amplifier; twin-T bandpass amplifier, 20-dB, 10 MHz bandpass amplifier; and voltage follower.
RCA ICAN-5213 (6 pg.)

18 **"Application of RCA CA3033 and CA3033A High Performance Integrated-Circuit Operational Amplifiers"**
(CA3033, CA3033A)
Describes the basic circuit and operation. Covers application as a 250 mw, power amplifier and shows use in a DVM as a multivibrator, staircase generator, and comparator.
RCA ICAN-5641 (8 pg.)

19 **"Applications of the CA3080 and CA3080A High-Performance Operational Transconductance Amplifiers"**
(CA3090, CA3080A)
This device has an additional control terminal for flexibility. Circuit operation is discussed. Applications covered: communications and industrial systems, modulators, multiplexers, sample and hold circuits, gain control circuits, and micropower comparators. Appendix discusses current mirrors.
RCA ICAN-6668 (16 pg.)

Amplifiers, Operational (cont)

1 **"Measurement of Burst (Popcorn) Noise in Linear Integrated Circuits"**
Discusses "pass-fail" criteria and describes a test set-up for measuring burst noise. The set-up includes a high grain amplifier-filter, a bipolar comparator, and a counter-latch-timer control circuit.
RCA ICAN 6732 (8 pg.)

2 **"L144 Programmable Micro-Power Triple Op Amp"**
(L144)
Describes device function, elements of programming, effects of slew rate limiting. Applications discussed include instrumentation amplifier, tone detectors, triple-amplifier active filters, and a micropower double-ended limit detector.
Siliconix AN73-6 (6 pg.)

3 **"Operational Amplifier Parameter Definition and Measurement Guide"**
Defines parameters and means of measuring them.
Teledyne Philbrick AN-23 (8 pg.)

4 **"Logarithmic Amplifiers and Operators Parameter Definition and Measurement"**
Defines and explains logarithmic amplifier parameters.
Teledyne Philbrick AN-27 (3 pg.)

5 **"The Instrumentation Amp vs the Op Amp: Which, Where, and How to Use Them"**
See listing under (Linear) Amplifiers, Instrumentation (Teledyne Philbrick)

6 **"Designing with TL080 BIFET Op Amps"**
(TL080, TL081, TL082, TL083, TL084)
Presents data sheet information, performance characteristics, and various applications including an IC preamplifier, a positive feedback bandpass filter, and a quadrature oscillator.
Texas Instruments CA-193 (11 pg.)

Amplifiers, Power

7 **"D.C. Servo Motor Systems Using the ICH8510"**
(ICH8510)
Explains servo systems in general and use of the device for velocity control, position control, and torque control in particular.
Intersil Application Bulletin A026 (4 pg.)

8 **"Power D/A Converters Using the IH8510"**
See listing under (Linear) Converters (Intersil)

9 **"The MC1554 One-Watt Monolithic Integrated Circuit Power Amplifier"**
(MC1554)
Describes the circuit, including dc characteristics, frequency response, and distortion. Shows how to calculate package power dissipation using the curves on the data sheet. Describes application, as one watt non-inverting, inverting, pulse power, and three-watt differential output amplifiers.
Motorola AN-401 (7 pg.)

10 **"Audio Handbook"**
See listing under (Linear) Consumer, Audio (National)

11 **"LM380 Power Audio Amplifier"**
See listing under (Linear) Consumer, Audio (National)

Amplifiers, Power (cont)

12 **"LM377, LM378, LM379 Dual Two, Four, and Six Watt Power Amplifiers"**
(LM377, LM378, LM379)
Discusses operation, choice and use of these circuits in audio applications. Covers distortion and heat dissipation. Also covers use in a bridge configuration, plus use as a Wein bridge power oscillator, motor drive, power comparator, relay and lamp driver.
National AN-125 (11 pg.)

13 **"Application of the RCA CA3020 and CA3020A Integrated Circuit Multi-Purpose, Wide-Band Power Amplifiers"**
(CA3020, CA3020A)
Circuit description and operation. Both circuits operate from single supply voltage as low as +3 v, offer voltage gains over 60 dB with a 3 dB bandwidth of 8 MHz. Discussion of audio, broadband and video amplifier, video line driver, motor controller and servo amp applications.
RCA ICAN-5766 (8 pg.)

14 **"TBA820 Two-Watt Monolithic Audio Amplifier"**
(TBA820)
Lists main electrical characteristics of device and presents typical applications.
SGS-ATES Technical Note 114 (11 pg.)

15 **"TCA940 Fully Protected Audio Amplifier"**
(TCA940)
Presents temperature and output short circuit protection features of the device along with a description of its performance. Illustrates use of the device in a stereo amplifier and an equalized amplifier for magnetic pickups.
SGS-ATES Technical Note 119 (15 pg.)

16 **"TBA810S/AS Thermally Protected Power Amplifier"**
(TBA810)
Description of the device followed by discussion of its performance. Also shows examples of use in tone control, TV, radio and tape playback channel applications.
SGS-ATES Technical Note 120 (16 pg.)

17 **"TCA830S-Thermally Protected Audio Power Amplifier"**
(TCA830S)
Briefly describes how the device functions followed by an examination of performance under different supply and load conditions. Portable AM/FM receiver, intercom, and magnetic tape player circuits are shown.
SGS-ATES Technical Note 126 (15 pg.)

18 **"TDA2020/TDA2010 HI-FI Monolithic Amplifiers"**
(TDA2020, TDA2010)
Describes these power amplifiers and how to apply them.
SGS-ATES Technical Note 130 (12 pg.)

Amplifiers, RF

19 **"An Integrated Circuit AGC IF Amplifier"**
(μA757)
Describes circuit and performance of μA757, which is recommended for applications in military and industrial equipment, also speech compressor amplifiers.
Fairchild Application Note 204 (4 pg.)

©IC MASTER 1979

LINEAR

Amplifiers, RF (cont)

1 **"A High Gain Integrated Circuit RF-IF Amplifier with Wide Range AGC"**
(MC1590G)
Describes operation and Y parameters of the MC1590G. Applications include mixer plus IF, video, single and two-stage RF amplifiers.
Motorola AN-513 (10 pg.)

2 **"A Two-Stage 1kW Solid-State Linear Amplifier"**
Discusses the design of 50W and 300W linear amplifiers for the 1.6 to 30 MHz frequency band.
Motorola AN-758 (16 pg.)

3 **"Linear Amplifiers for Mobile Operation"**
Discusses the design of a portable amplifier suitable for amateur radio applications.
Motorola AN-762 (8 pg.)

4 **"A Complete Monolithic AM/FM/SSB IF Strip"**
See listing under (Linear) Consumer, AM/FM (National)

5 **"Applications of the LM173/LM273/LM373"**
(LM173, LM273, LM373)
Discusses FM, AM, and SSB operation of this multi-mode IF amplifier/detector.
National Linear Applications Handbook, Vol. I, LB-13 (2 pg.)

6 **"Tuned Circuit Design Using Monolithic RF/IF Amplifiers"**
(LM171, LM703)
Discusses operating parameters for the LM171 and LM703 in emitter-coupled and cascode configurations. Brief description of 10.7 MHz emitter-coupled stage and 100 MHz cascode amplifier.
National Linear Applications Handbook, Vol. I, AN-6 (6 pg.)

7 **"Logarithmic IF Strips Using Monolithic Integrated Circuits"**
(SL521)
Describes operation of this log amplifier in successive detection type IF strips with center frequencies from 10 to 100 MHz. Covers broadband and narrow band circuits and describes in detail a 60 MHz wide-range logarithmic amplifier.
Plessey Semiconductor Technical Communication (3 pg.)

8 **"Logging IF Strip"**
(SL1521)
Describes a logging IF strip using Plessey IC's.
Plessey Semiconductor (2 pg.)

9 **"Application of the RCA CA3004, CA3005, and CA3006 Integrated-Circuit RF Amplifiers"**
(CA3004, CA3005, CA3006)
Discusses operating modes, Y parameters, noise performance, video amp capabilities, gain control, cross modulation and modulation distortion. Covers application as single-ended RF amplifier, tuned IF amplifier, mixer, suppressed-carrier modulator and product detector.
RCA ICAN-5022 (26 pg.)

10 **"Application of the RCA CA3002 Integrated-Circuit IF Amplifier"**
(CA3002)
Describes circuit, operating modes, characteristics, and application as an envelope detector, product detector, and a Schmitt trigger.
RCA ICAN-5036 (9 pg.)

Amplifiers, RF (cont)

11 **"Application of the RCA CA3028A and CA3028B Integrated-Circuit RF Amplifiers in the HF and VHF Ranges"**
(CA3028A, CA3028B)
Describes circuits and operating modes. Covers use as an RF amp, autodyne converter, IF amp, and limiter.
RCA ICAN-5337 (10 pg.)

12 **"Application of the RCA CA3021, CA3022, and CA3023 Integrated-Circuit Wideband Amplifiers"**
(CA3021, CA3022, CA3023)
Describes circuit and operating characteristics. Covers video, 10 MHz IF, 455 KHz IF, 28 MHz two-stage limiter, and 500 kHz limiting amplifier applications.
RCA ICAN-5338 (12 pg.)

Amplifiers, Sense

13 **"Semiconductors for Plated-Wire Memories"**
See listing under (Digital) Interface (Motorola)

14 **"An Integrated Sense Amplifier for Core Memories"**
(MC1440, MC1540)
Discusses core memories and design considerations for a sense amplifier. Establishes performance and environment specs for amplifier design, analyzes design of MC1540, and discusses measured performance.
Motorola AN-245A (7 pg.)

Amplifiers, Video

15 **"A Wide Band Monolithic Video Amplifier"**
(MC1552G, MC1553G)
Describes basic operation of the MC1552G and MC1553G, and the characteristics obtained as a function of the devices' operating modes. Applications: pulse amplifier, summing/scaling amplifier, oscillator, and tuned amplifier.
Motorola AN-404 (13 pg.)

16 **"Using the MC1545, A Monolithic Gated Video Amplifier"**
(MC1445, MC1545)
Describes ac and dc operations and discusses applications as a video switch, amplitude modulator, balanced modulator, pulse amplifier, frequency shift keyer and wideband differential amplifier.
Motorola AN-475 (7 pg.)

17 **"Gated Video Amplifier Applications — The MC1545"**
(MC1445, MC1545)
Reviews basic operation and discusses applications, including several modulators, gated multivibrators, gated oscillators and FSK systems. Also discusses AGC, single supply operations, and temperature compensation of the active gate.
Motorola AN-491 (15 pg.)

18 **"Television Video IF Amplifier Using Integrated Circuits"**
See listing under (Linear) Consumer, TV (Motorola)

19 **"Application of the RCA CA3001 Integrated-Circuit Video Amplifier"**
(CA3001)
Describes circuit and operating characteristics. Covers cascaded stages and use as a Schmitt trigger.
RCA ICAN-5038 (9 pg.)

LINEAR

Amplifiers, Video (cont)

1 **"The SG1401 Video Amplifier"**
(SP1401)
Discussion of fixed and variable gain. The high frequency stability is discussed to aid in optimizing the various configurations for this device.
Silicon General Linear IC Product Guide (2 pg.)

Arrays

2 **"Using the SL362C Low Noise Transistor Pair"**
(SL362)
Provides general data on noise performance plus application in DC to 200 MHz amplifier.
Plessey Semiconductor Technical Communication (4 pg.)

3 **"Application of the RCA CA3018 Integrated Circuit Transistor Array"**
(CA3018)
Array of two isolated silicon epitaxial transistors plus two transistors with emitter-base common connections, suited for closely matched device requirements or interconnections with non-integrable components. Applicationes covered include IF-RF, video, AGC, audio and dc amplifiers.
RCA ICAN-5296 (5 pg.)

4 **"Application of the RCA CA3019 Integrated-Circuit Diode Array"**
(CA3019)
Describes circuit configuration, operating characteristics and applications, including balanced modulator, high-speed gates, balanced mixer, and a ring modulator.
RCA ICAN-5299 (6 pg.)

5 **"Designing with an IC Transistor Array Containing Matched Super-Beta Transistors"**
(CA3095)
Describes CA3095 IC array. Applications: low frequency amplifier, low noise video amplifier, long-delay monostable multivibrator, low-input-bias current comparator, analog timer for long delays, high input impedance dc-voltmeter circuit, and tape-head preamplifier.
RCA ICAN-6222 (9 pg.)

6 **"Monolithic Darlington Arrays Reduce Interface Cost and Complexity"**
(ULN-2001A, ULN-2002A, ULN-2003A)
Discusses packaging and heat dissipation of these 50v, 100-350 ma units. Covers parallel operation, input currents and control of up to 125 watts.
Sprague Electric Microcircuit Application Report MAR 75-2 (8 pg.)

7 **"Series ULN-2000A Darlington Transistor Arrays-Description and Application"**
(ULN-2001A, ULN-2002A, ULN-2003A ULN-2004A)
Describes circuit capabilities and its use as an interface.
Sprague (7 pg.)

Communications

See also (Digital) Data Transmission

8 **"S2559 Digital Tone Generator"**
(S2559)
Describes a tone generator designed specifically to implement a dual tone telephone dialing system.
American Microsystems (12 pg.)

Communications (cont)

9 **"XR-C240 Monolithic PCM Repeater"**
(XR-C240)
Provides device description, description of circuit operation, and schematics for a typical repeater system.
Exar AN-02 (6 pg.)

10 **"XR-C277 Low-Voltage PCM Repeater IC"**
(XR-C277)
Explains PCM repeater fundamentals, device operation, and presents schematic for a repeater application.
Exar AN-04 (6 pg.)

11 **"Dual Tone Decoding"**
(XR567, XR2567)
Discusses and presents diagrams for a fast, narrow band tone decoder, a touch-tone decoder, and a low cost frequency indicator.
Exar AN-08 (2 pg.)

12 **"High Performance PCM Repeater Using XR-C262"**
(XR-C262)
The design principle and the electrical characteristics of the XR-C262 high performance PCM repeater IC are described. Circuit connection and application examples are given in its use in 1.5 Megabit or 2 Megabit PCM systems.
Exar AN-10

13 **"Pushbutton Dialer with Memory"**
(AY5-9100, AY5-9200, AY5-9500)
Provides instructions, diagram, and PC board layout for an add-on device that connects to any telephone and permits dialing via a separate keyboard. The module has a redial mode and a 20-digit 10 number expandable memory.
General Instrument Bulletin 0701 (7 pg.)

14 **"A 10-Number Repertory Pulse Dialer"**
(AY5-9100, AY5-9200, AY5-9500)
Diagram and short description of a telephone pulse dialer with capability for storage and reference of 10 numbers of up to 22 digits each.
General Instrument Bulletin 0702 (2 pg.)

15 **"One-Button 32 Number Repertory Dialer/Calculator"**
(AY5-9200, AY5-9120)
The circuit described features one-button redial of one of 32 storable telephone numbers of up to 22 digits each. The 8-digit calculator features five functions, including percent.
General Instrument Bulletin 0706 (6 pg.)

16 **"The Impact of LSI on the Design of PCM Codecs"**
Discusses the changes existing telephone systems will go through as LSI circuits are increasingly used for PCM and computer controlled switching.
General Instruments Bulletin 0707 (4 pg.)

17 **"HC-55516/32 CVSD Concept and Operations"**
(HC55516, HC55532)
Outlines Continuously Variable Slope Delta Modulation and compares it to pulse code modulation.
Harris (5 pg.)

18 **"A CB Audio Compression System"**
(MONOCHIP)
Describes using the device to provide an on-chip regulator, audio pre-amp, AGC amplifier, DC volume control, and a headphone driver amplifier for use in a CB transceiver.
Interdesign APN-10 (7 pg.)

©IC MASTER 1979

LINEAR

Communications (cont)

1 **"Communication System Transmission Losses"**
Derives equations for computing insertion losses for components in a communication system. Gives computer generated tables, series resistance and reactance plus parallel resistance and reactance for various system impedances.
Motorola AN-710 (5 pg.)

2 **"Two Wire Current Transmitters"**
(LM304)
Describes a method for accurately transmitting analog data over long distances using only two wires.
National Semiconductor LB-40 (2 pg.)

3 **"A Unique Monolithic AGC/Squelch Amplifier"**
(LM170, LM270, LM370)
Describes operation of LM170. Applications: AGC circuits with peak or with transistor detectors, squelch preamplifier with hysteresis, voice-operated-relay controls, Wein bridge oscillators, decade tunable oscillators, and a modulated 455 kHz signal generator.
National AN-51 (12 pg.)

4 **"SL600 Series — Integrated Circuits for Radio Communications"**
(SL600 Series)
Describes circuits and applications for the following: RF/IF amplifiers; limiting RF amplifier/detector; AGC generators; AF amplifier, VOGAD side tone amplifier, AM detector, AGC amplifier and SSB demodulator; multimode detector; microphone/headphone amplifier; double balanced modulators; and a square log device. Describes synchrodyne, superhet, SSB and multimode receivers; SSB and AM transmitters; SSB transceiver, a multi/mode transceiver and a Morse keyer.
Plessey Semiconductor Applications Manual (92 pg.)

5 **"CRC8030 Telephone DTMF Receiver"**
(CRC8030)
Discusses dual-tone multi-frequency signaling. Includes specifications, test data, and interface capabilities.
Rockwell Application Note (28 pg.)

6 **"The CRC8030 Dual Tone Multi-Frequency Receiver"**
(CRC8030)
Discusses various approaches to DTMF receiver design and DTMF signaling. Includes a chart of receiver specifications and a description of the device.
Rockwell (11 pg.)

7 **"Applications of CMOS Integrated Circuits in Communications Equipment"**
See listing under (Digital) CMOS. (Solid State Scientific)

8 **"Modems"**
See listings under (Digital) Data Transmission

Comparators

9 **"AM685/AM686/AM687 Designing with High Speed Comparators"**
(685, 686, 687)
Gives a mathematical analysis of circuit operation. Discusses use as a pulse detector, precision monostable and applications requiring hysteresis.
Advanced Micro Devices Application Note (10 pg.)

Comparators (cont)

10 **"Varying Comparator Hysteresis without Shifting Initial Trip Point"**
Describes adding a positive feedback circuit to introduce precise variable hysteresis into the usual comparator switching action.
Burr-Brown AN-62 (1 pg.)

11 **"The μA760 — A High Speed Monolithic Voltage Comparator"**
(μA760)
Gives a functional description and cites typical performance characteristics. Discusses applications, including level detectors and line receivers, zero crossing detectors, high speed A/D converters, pulse width modulators, and fast peak detectors.
Fairchild Application Note 311 (8 pg.)

12 **"The μA750 Dual Comparator Subsystem"**
(μA750)
Discusses the circuit, design considerations and applications, including use in a combined heater/air conditioner control, a malfunction indicator, an analog status indicator and display, and a minimum frequency detector.
Fairchild Application Note 315 (7 pg.)

13 **"Radiation Testing of Linear Microcircuits"**
Includes the 702. See listing under (Linear) General. (Fairchild)

14 **"A Simple Comparator Using the HA2620"**
See listing under (Linear) Amplifiers, Operational (Harris)

15 **"A High Speed Dual Differential Comparator — the MC1514"**
(MC1414, MC1514)
Describes circuit operation and applications, including level and limit detectors, multivibrators, line receivers, sense amplifiers, zero crossing pulse generator and a peak voltage detector.
Motorola AN-547 (13 pg.)

16 **"Precision IC Comparator Runs from 5V Logic Supply"**
(LM111, LM211, LM311)
Describes the LM111 circuit. Applications: photodiode level detector, zero crossing detectors, digital interface circuits, multivibrators, oscillators, and a frequency doubler. Includes application hints.
National Linear Applications Handbook, Vol. I, AN-41 (6 pg.)

17 **"LM139/LM239/LM339 — A Quad of Independently Functioning Comparators"**
(LM139, LM239, LM339)
Describes LM139 circuit. Applications: comparators with hysteresis, limit comparators with lamp drivers, zero crossing detectors, oscillators, MOS clock drivers, wide range VCO, AND/NAND gates, OR/NOR gates, multivibrators, time delay generators, pulse width modulator, temperature alarm, tape reader and peak detector.
National AN-74 (16 pg.)

18 **"Application of Programmable Micropower Comparators"**
(L161)
Describes the device and how to program it. Also describes the effects of programming on AC characteristics, limit, zero crossing, and level detectors; DC to DC converter applications.
Siliconix AN76-7

19 **"Comparing the High Speed Comparators"**
(LM160, LM161, LM260, LM261, LM360, LM361)
Compares LM360 to μA760 and LM261 to NE529. Covers application as a peak detector for tape and disk file channels and in a high-speed 3-bit A/D converter.
National AN-87 (6 pg.)

LINEAR

Comparators (cont)

1 **"Fast Voltage Comparators with Low Input Current"**
(LM102, LM106, LM202, LM206, LM302, LM306)
Describes use of LM102 to buffer the input of the LM106 comparator. Applications: comparators for fast A/D converters, for zero crossing detectors, and for ac coupled signals.
National Linear Applications Handbook, Vol. I, LB-6 (2 pg.)

2 **"An IC Voltage Comparator for High Impedance Circuitry"**
(LM111, LM211, LM311)
Describes LM111 circuit and comparison to LM106/LM710. Applications: zero crossing detector driving an analog switch, detector for a magnetic transducer, comparator for a low level photodiode, and driving a ground-referred load.
National Linear Applications Handbook, Vol. I, LB-12 (2 pg.)

3 **"Specifying Selected Op Amps and Comparators"**
Discusses the most common parameters that are tested on operational amplifiers and comparators and the relative difficulty of testing on high speed equipment. Gives a guideline to tightened specifications.
National Linear Applications Handbook, Vol. II, LB-26 (2 pg.)

4 **"Circuit Techniques for Avoiding Oscillations in Comparator Applications"**
(LM111)
Details design techniques for avoiding oscillations when using high gain, wide bandwidth comparators like the LM11.
National Semiconductor LB-39 (2 pg.)

5 **"Microvolt Comparator"**
(LM111, LM211, LM311, LM121A, LM221A, LM321A)
Describes an LM121A preamplifier driving an LM111 comparator.
National Linear Applications Handbook, Vol. II, LC-32 (2 pg.)

6 **"The 725 Op Amp as a Low Level Comparator"**
(PM725)
Provides the circuit and design curves for a submillivolt level comparator based on the 725 op amp.
Precision Monolithics AN-25 (4 pg.)

Consumer, AM/FM

7 **"Frequency Selective AM Detection Using Monolithic Phase-Locked Loops"**
(XR2228, XR215, XR2212)
Design of frequency selective coherent AM and AM/FM demodulator systems using these devices is described.
Exar AN-13

8 **"Integrated Circuits for FM Receivers"**
(μA703, μA753, μA758, μA3075)
Describes ICs capable of performing all basic functions of an FM stereo receiver, except the front end. Discusses 753 IF block, CA3075 2nd IF block, 758 stereo multiplex decoder, 706 audio power amplifier.
Fairchild Application Note 318 (7 pg.)

9 **"The μA758 — A Phase Locked Loop FM Stereo Multiplex Decoder"**
(μA758)
Gives functional description of this device, including input buffer/amplifier and bias supply, demodulator, stereo switch and lamp driver, VCO, frequency dividers, pilot phase and amplitude detectors. Discusses operating characteristics, testing and alignment.
Fairchild Application Note 319/1 (11 pg.)

Consumer, AM/FM (cont)

10 **"The μA732 and μA767 Integrated Circuit Stereo Multiplex Decoders"**
(μA732, μA767)
Discusses stereo demodulation, stereo/monaural switching, and interstation audio mute switching sections of these devices. Describes performance characteristics, external components required, alignment and user options.
Fairchild Application Note 286 (8 pg.)

11 **"A Fully Integrated High Quality AM/FM Stereo Receiver"**
(μA706, μA720, μA739, μA753, μA758, μA3075)
Describes receiver using ICs with a comparison to discrete design.
Fairchild Application Note 328/1 (6 pg.)

12 **"ZN414 — The One Chip Radio Receiver"**
(ZN414)
Describes various applications for single-chip IC radio, and suggests a new approach to AM receiver design.
Ferranti (16 pg.)

13 **"FM Tuner Using the Economega I Digital Tuning System"**
(Economega)
Describes modification of a Goodman model 1-20 tuner amplifier to include a GI automatic tuning system and display. Presents schematics as well as descriptions of various changes made.
General Instrument Bulletin 0407 (7 pg.)

14 **"Digital Frequency Display for a Radio-Receiver"**
(AY5-1200A, AY5-8100)
Explains details of interfacing the devices with a radio receiver. Provides circuit description and diagram plus a layout for a PC board showing pre-amp and display connections.
General Instrument Bulletin 0409 (11 pg.)

15 **"Adjusting the IF Offset of the AY5-8100"**
(AY5-8100)
Depicts adjusting the IF offset of the device in 10 KHz steps.
General Instrument Bulletin 0410 (2 pg.)

16 **"Radio Receiver Frequency Counter/Clock"**
Supplies diagram and operating instructions for using each device to display time or frequency on a 3½ digit display.
General Instrument Bulletin 0411 (3 pg.)

17 **"Stereomega Phase-Locked Loop Digital Tuning Systems"**
(Stereomega, AY3-8115, AY3-8116, AY5-8450, AY5-8460, ER1400)
Presents use of system in four applications which provide full electronic control of a varactor-tuned AM/FM radio: basic manual, basic manual with clock, basic remote controlled, and deluxe remote-controlled. Includes diagrams and schematics.
General Instrument Bulletin 0412 (11 pg.)

18 **"Manual and Automatic FM Tuning System Using Economega I"**
(Economega, AY3-8203, ER1400, MEM4956)
Describes a system that allows manual tuning of a Goodman 1-20 tuner with non-volatile electronic storage of tuning data for 16 stations. Diagrams, schematic.
General Instrument Bulletin 0414 (4 pg.)

19 **"Integrated Circuit IF Amplifiers for AM/FM and FM Radios"**
(MC1350, MC1355, MC1357, MFC4010, MFC6010)
Discusses the use of ICs in four IF amplifiers: a high performance FM, a quadrature detector FM, a composite AM/FM, and an economy model FM receiver.
Motorola AN-543A (14 pg.)

©IC MASTER 1979

LINEAR

Consumer, AM/FM (cont)

1 **"Scanning Logic for RF Scanner-Receivers Using CMOS Integrated Circuits"**
See listing under (Digital) CMOS (Motorola)

2 **"A Complete Monolithic IF Strip for AM/AGC Applications**
(LM172, LM272)
Circuit operation of LM172/LM272. Covers application in superheterodyne and low frequency T.R.F. receivers.
National Linear Applications Handbook, Vol. I, AN-15 (6 pg.)

3 **"A Complete Monolithic AM/FM/SSB IF Strip"**
(LM273, LM373, LM274, LM374)
Discusses LM273/LM373, and LM274/LM374 IF amplifier/detectors. Includes description of FM, SSB, and AM detection. Applications include: FM slope detector, double conversion IF strip, and coherent phase locked receiver. Also includes application hints.
National AN-54 (8 pg.)

4 **"Low Cost IC Stereo Receiver"**
(LM1800, LM1820, LM3089)
Describes the complete circuit and performance of an AM/FM/Stereo receiver.
National AN-147 (4 pg.)

5 **"FM Remote Speaker System"**
Describes an FM transmitter which couples to its companion receiver thru the power lines. The system transmits speech or music and is suitable for home use as well as some factory applications.
National AN-146 (4 pg.)

6 **"Low Cost AM Radio System Using LM1820 and LM386"**
(LM1820, LM286)
Presents circuit diagram of a simple AM radio without an rf preamplifier ahead of the mixer.
National Linear Applications Handbook, Vol. II, LB-29 (2 pg.)

7 **"Audio Handbook"**
See listing under Consumer, Audio (National)

8 **"AM/SSB Transceivers and Noise Blanking Using SL1600 Series Circuits"**
(SL1623, SL1626, SL1640, SL1641)
Describes the sub-systems used in AM-SSB transceivers.
Plessey Semiconductor (10 pg.)

9 **"An SSB Transceiver for Citizens' Band Using Plessey SL1600 Integrated Circuits**
(SL1600 series)
Describes the design of a SSB transceiver.
Plessey Semiconductor (4 pg.)

10 **"An AM Receiver Using the Plessey SL1600 Series"**
(SL1600 series)
Describes the design of a simple AM receiver.
Plessey Semiconductor (7 pg.)

11 **"SL1600 Series Transceiver Applications"**
(SL1600 series)
Discusses simple SSB and multimode transceiver design.
Plessey Semiconductor (32 pg.)

12 **"Integrated Circuits for FM Broadcast Receivers"**
(CA3005, CA3011, CA3012, CA3013, CA3014)
Discusses circuits for FM tuner, IF amplifier, limiter, and detector applications.
RCA ICAN-5269 (7 pg.)

Consumer, AM/FM (cont)

13 **"Integrated-Circuit Frequency-Modulation IF Amplifiers"**
(CA3012, CA3028)
Describes CA3012 and CA3028 differential amplifiers and application in IF-amplifier strips.
RCA ICAN-5380 (7 pg.)

14 **"Application of the CA3089E FM-IF Subsystem"**
(CA3089)
Discusses stability considerations and following circuits: quadrature-detector, audio and AFC, mute, tuning meter and rf-agc, if amplifier/detector system and stereo decoder. Also covers operation at frequencies other than 10.7 MHz.
RCA ICAN-6257 (8 pg.)

15 **"Integrated-Circuit Stereo Decoder Using the CA3090AQ Stereo Multiplex Demodulator"**
(CA3090AQ)
Gives circuit description. Describes the LC oscillator, reactance, stereo defeat, dc coupled flip-flop preamplifier and phase splitter circuits.
RCA ICAN-6259 (10 pg.)

16 **"TDA1200 FM-IF System for High Performance Radio Receivers"**
(TDA1200)
Gives a detailed description of the device. Describes relative performance of device when used in an FM tuner, an AM/FM car radio, and a portable AM/FM radio.
SGS-ATES Technical Note 117 (12 pg.)

17 **"ULN-2204A AM/FM Receiver System"**
(ULN-2204)
Presents operation of device and discusses typical applications.
Sprague AN-27121.51 (12 pg.)

18 **"A Complete AM/FM Single Processing System"**
(ULN-2242)
Describes a circuit which simplifies AM/FM receiver design and improves performance. Includes diagrams and graphs.
Sprague TP77-6 (10 pg.)

Consumer, Audio

19 **"MOS Circuit for Electronic Organs"**
(S2193, S2688, S8890, S10110, S10129, S10130, S10131, S50240, S50241, S50242)
Describes the use of ICs for various electronic organ circuits.
American Microsystems AP74-10 (7 pg.)

20 **"An Electronic Music Synthesizer Using the XR2207 and the XR2240"**
(XR2207, XR2240)
Design of a simple, low-cost "music synthesizer" system is described.
Exar AN-15

21 **"Applications of the μA739 and μA749 Dual Preamplifier Integrated Circuits in Home Entertainment Equipment"**
(μA739, μA749)
Describes circuit operation. Discusses d-c and a-c considerations, compensation and noise performance. Covers applications as a stereo tape amplifier, a high fidelity phonograph preamplifier, and a TV remote control amplifier.
Fairchild Application Note 171 (7 pg.)

Consumer, Audio (cont)

1 **"A High Output Power, (5 Watt), Low Distortion, IC Audio Amplifier"**
(μA706)
Describes circuit, functions, design considerations of the μA706. Discusses application as an audio amplifier with the speaker load connected to ground, with the speaker load between supply and output, and discusses use in an FM stereo receiver.
Fairchild Application Note 317/1 (6 pg.)

2 **"An Electronic Piano Using the AY-1-1320"**
(AY1-0212, AY1-1320, AY1-5050)
Presents circuit diagrams and description of an electronic piano using a divider, a top octave generator and the device.
General Instrument Bulletin 0501 (5 pg.)

3 **"Designing a Basic Organ System Using the MK50240"**
(MK50240)
Describes an organ system using the MK50240 Top Octave Generator for each octave.
Mostek (3 pg.)

4 **"LM380 Power Audio Amplifier"**
(LM380)
Describes the circuit and general operating characteristics. Applications: phono amplifier, bridge amplifier, and intercom.
National AN-69 (7 pg.)

5 **"Audio Handbook"**
(LM171, LM377, LM378, LM379, LM380, LM381, LM382, LM384, LM386, LM387, LM388, LM389, LM390, LM391, LM703, LM1303, LM1310, LM1351, LM1800, LM1820, LM2111, LM3011, LM3065, LM3075, LM3089, MM5837)
Contains discussions and design particulars on many areas including preamplifiers; AM, FM, and Stereo; power amplifiers; controls, networks and power supply design—covers practical as well as theoretical aspects.
National $4.00 (188 pg.)

6 **"Audio Applications for the DAC-76 Companding Converter"**
(DAC-76)
Discusses the multiplying and control characteristics of the DAC-76 with regard to 2C inputs, as an aid to optimizing high-performance digitally-controlled gain circuits.
Precision Monolithics AN-28 (8 pg.)

7 **"Application of the RCA CA3007 Integrated-Circuit Audio Amplifier"**
(CA3007)
Describes circuit. Covers application as dual-supply audio driver in a direct-coupled audio amp, and as single-supply audio driver in a capacitor-coupled audio amp.
RCA ICAN-5037 (4 pg.)

8 **"Use of Analog Delay Lines for Audio Speed Change without Pitch Changes"**
(SAD1024A)
Describes technique for increasing or slowing the speed of a recording.
Reticon Application Note No. 112 (4 pg.)

9 **"Build a Simple Comb-Filter or Flanger with a Bucket Brigade Delay Line"**
(SAD1024A)
Describes a flanger (electronic sound modifier) and what is needed to build one.
Reticon Application Note No. 113 (4 pg.)

Consumer, Audio (cont)

10 **"TDA1054M — Cassette Recorder Preamplifier with ALC"**
(TDA1054M)
Discusses features of the device and preamplifier noise. Applications in Hi-Fi, stereo, and dynamic range compressors are described.
SGS-ATES Technical Note 124 (24 pg.)

11 **"M252 and M253 Rhythm Generators for Electronic Organs"**
(M252, M253)
Defines and describes rhythm generators. Presents these two devices, and describes their use in electronic organs.
SGS-ATES Technical Note 131 (21 pg.)

12 **"TCA600/900 and TCA610/910 Integrated Motor Speed Regulators"**
See listing under (Linear) Industrial Control (SGS-ATES)

13 **"The ULN-2280 Amplifier"**
(ULN-2280)
Describes this single power amplifier circuit and discusses applications as a low-cost phonograph amplifier, amplifier with tone controls, common mode amplifier, full bridge amplifier, and a mono FM receiver.
Sprague Electric Microcircuit Application Report MAR 73-2 (8 pg.)

14 **"Low-Cost-Dual Class B Driver"**
(ULN-2277, ULN-2278)
Describes the ULN-2277/78 ICs and describes use in dual 2-watt and dual 15-watt amplifiers.
Sprague Electric Microcircuit Application Report MAR 73-5 (3 pg.)

Consumer, Medical

15 **"A Personalized Heart-Rate Monitor with Digital Readout"**
(MC1776, MC14013, MC14040, MC14572)
Describes digital heart-rate monitor using the MC1776 op amp and CMOS digital ICs.
Motorola AN-714 (4 pg.)

Consumer, TV

16 **"A Ten Game Color Video System Using the AY3-8610-1"**
(AY13-8610-1, AY3-8615)
Furnishes diagram and PC board layout of a color TV game circuit incorporating the devices.
General Instrument Bulletin 0401A (3 pg.)

17 **"A Tank "Battle" TV Game Using the AY3-8710-1"**
(AY3-8710-1)
Supplies diagram and description of a TV game circuit which provides an NTSC compatible signal to operate a standard 525-line TV receiver and produces a black and white picture.
General Instrument Bulletin 0402A (4 pg.)

18 **"World Television Systems"**
Furnishes, in chart form, the characteristics of various television systems. Includes such data as line standards and channel frequency assignments.
General Instrument Bulletin 0403 (2 pg.)

©IC MASTER 1979

LINEAR

Consumer, TV (cont)

1 **"PAL Colour Encoding Systems for the AY3-8500 TV Game Circuit"**
(AY3-8500)
Briefly describes the PAL system, then presents two alternate circuits for color encoding the AY3-8500 TV game according to PAL.
General Instrument Bulletin 0404 (8 pg.)

2 **"Video Game FM Sound Generator"**
Describes a system that enables a TV sound system to be used for game sounds as well.
General Instrument Bulletin 0405 (2 pg.)

3 **"Wireless Remote Control of the AY3-8710-1 Battle Game"**
(AY3-8710-1, SAA1024, SAA1025)
Presents system diagrams, logic, and pin connections for an ultrasonic remote control unit utilizing the devices.
General Instrument Bulletin 0408A (5 pg.)

4 **"Economega I Digital Tuning for Television Receivers"**
(Economega, MEM4956, ER1400, SAA1025)
Describes a digital TV tuning system capable of automatic search and acquisition of up to 16 different TV programs. Supplies system block diagram as well as schematics for individual circuits.
General Instrument Bulletin 0413 (7 pg.)

5 **"On-Screen Displays for Television"**
(AY3-8330, AY5-8321)
Examines an on-screen tuning display with 16 selectable programs. Includes TV interface and system schematics.
General Instrument Bulletin 0415 (4 pg.)

6 **"The Gimini Economy 8600 Programmable Game System"**
(AY3-8615)
Describes use of the AY3-8615 game/color processor in a system designed to be priced near that of dedicated game systems, but with a cartridge expandability.
General Instrument Bulletin 0416 (4 pg.)

7 **"Videovox II: Video Color Organ"**
(AY3-8515)
On receiving an audio input from either a crystal mike or an external source, the circuit described generates a color composite video signal, modulated and suitable for use with color TV.
General Instrument Bulletin 0417 (4 pg.)

8 **"Economega I Digital Tuning for UK Televisions"**
(Economega)
Describes two eight program UHF band versions of the Economega System specifically for U.K. market. Conventional AFC is retained for simplicity. Includes a manually controlled search feature.
General Instrument Bulletin 0420 (4 pg.)

9 **"Television Video IF Amplifier Using Integrated Circuits"**
(MC1330, MC1350, MC1352, MC1353)
Discusses requirements of the video IF section of a TV receiver. Describes MC1350/2/3 amplifier and MC1330 detector circuits. Includes design for a practical TV IF amplifier and detector.
Motorola AN-545 (11 pg.)

10 **"Television Horizontal APC/AFC Loops: The Last 10 Percent"**
Discusses some of the common problems that may be encountered in the design of horizontal APC/AFC loops and methods to avoid or overcome them.
Motorola AN-727 (15 pg.)

Consumer, TV (cont)

11 **"A Medium Cost PLL Varactor Tuning System Utilizing Off-the-Shelf Logic"**
Describes a frequency domain tuning scheme for varactor TV tuners.
Motorola AN-729 (14 pg.)

12 **"A Synthetic Spectrum Tuning System for TV"**
Describes a tuning system which generates a complete spectrum of TV channel markers to achieve precise tuning on any channel.
Motorola AN-739 (12 pg.)

13 **"A Phase-Locked Loop Tuning System for Television"**
Describes a frequency domain tuning system using direct digital count down of the local oscillator.
Motorola AN-744 (10 pg.)

14 **"A Disassociated Intercarrier Television Video IF Amplifier"**
(MC1331)
Discusses a video IF system using the MC1331 low level multiplier detector.
Motorola AN-751 (9 pg.)

15 **"Video Amplifier Design: Know Your Picture Tube Requirements"**
(MC1323)
Describes video systems designed to alleviate design compromises associated with driving a unitized gun picture tube.
Motorola AN-761 (26 pg.)

16 **"The MC1323 — A Fully Programmable Demodulator"**
(MC1323)
Describes operation of this NTSC demodulator and use with various picture tube phosphors, especially color temperature D6500.
Motorola AN-763 (16 pg.)

17 **"An Approach to a Low-Noise TV IF System"**
(MC1331)
Discusses TV system noise figure and system trade offs, a technique to measure the IF contribution and ways to minimize the IF noise.
Motorola AN-765 (8 pg.)

18 **"A Color TV Primer for the EE"**
Describes the basic circuits in a TV and the IC's used therein.
National Linear Applications Handbook, Vol. II.

19 **"Programmable TV Timer/Time-Channel Display"**
(MM53107, MM53100, MM5840)
Describes an on-screen TV real time and channel display based on the devices. Includes schematics and PC board layout.
National Semiconductor AN-196 (10 pg.)
(CA3126)

20 **"Application of the RCA CA3044 and CA3044V1 Integrated Circuits In Automatic-Fine-Tuning Systems"**
(CA3044)
Describes circuits, operating characteristics and dynamic performance of this wideband amplifier for AFC applications.
RCA ICAN-5831 (5 pg.)

21 **"Feedback-Type Volume-Control Circuits for RCA CA3041 and CA3042 Integrated Circuits"**
(CA3041, CA3042)
Describes several types of volume controls for television receivers using these ICs, with a detailed discussion of feedback control.
RCA ICAN-5841 (4 pg.)

Consumer, TV (cont)

1 **"Application of the CA3126Q Chroma-Processing IC Using Sample-and-Hold Circuit Techniques"**
(CA3126Q)
Detailed circuit description of this device, which requires only one adjustment; a trimmer capacitor to tune the crystal filter. Discusses performance data, the phase detector, sample and hold circuits, the VCO loop, first chroma amplifier and ACC servo loop, and the second chroma amplifier.
RCA ICAN-6247 (8 pg.)

2 **"Description and Application of the RCA CA3120E Integrated-Circuit TV-Signal Processor"**
(CA3120)
Describes the operation and application of this device which includes TV video noise processor, agc and sync separator circuits.
RCA ICAN-6302 (9 pg.)

3 **"A Single IC for the Complete PIX-IF-System in TV Receivers"**
(CA3068)
Gives a detailed description of the circuit functions of the CA3068 and its use in color and b/w TV receivers.
RCA ICAN-6303 (17 pg.)

4 **"A Flexible Integrated-Circuit Color Demodulator for Color Television"**
(CA3067)
Describes circuit operation of the CA3067, including its output amplifiers, demodulator, demodulator preamp, and tint control amplifier. Describes use of this circuit in a red-green-blue system.
RCA ICAN-6724 (8 pg.)

5 **"Vertical Deflection Output Stages Using Audio Integrated Circuits"**
(TAA611, TAA621, TBA641, TBA800, TBA810, TBA820)
Characterizes the advantages and working principles of vertical deflection circuits using audio IC's. Seven circuits, covering small and large screen performance, are included.
SGS-ATES Technical Note 118 (18 pg.)

6 **"An Approach to a Unified Chroma System"**
Describes design approach that will eventually allow fabrication of a complete single-chip chroma system.
Sprague Electric TP 74-3 (9 pg.)

7 **"An Integrated Two-Watt Sound System for Television Applications"**
(ULN-2211)
Describes the design and use of the ULN-2211 limiter-detector-amplifier.
Sprague Electric TP 72-05 (9 pg.)

Converters

Also see Instrumentation.

8 **"Data Conversion with Companding DAC Devices"**
Introduces companding principles and use of companding DACs in industrial and PCM transmission systems. Provides companding DAC circuit description and discussion of how μ-Law and A-Law characteristics are generated. Application cover μP based data acquisition systems, motion control, audio systems, and telecommunication systems.
Advanced Micro Devices (36 pg.)

Converters (cont)

9 **"Analog-Digital Conversion Notes"**
Covers many aspects of A/D and D/A converters including use, testing and specifying. Extensive applications information includes data systems, acquisition, distribution, communication.
Analog Devices $5.95 (254 pg.)

10 **"The Multiplying DAC Application Guide"**
(AD7520, AD7521, AD7522, AD7523, AD7524, AD7525, AD7530, AD7531, AD7533, AD7541)
Discusses applications which take advantage of the MDAC's ability to accept AC or DC references, which can be of either polarity. Applications include digitally-controlled gain and attenuation circuits.
Analog Devices (40 pg.)

11 **"Beckman Model 845 Digital-to-Analog Converter"**
(845)
Discusses basic D/A converter performance including interface and transfer characteristics, then covers the performance of the 845 Series.
Beckman Instruments (9 pg.)

12 **"D/A Converter Differential Linearity Error — It Really Shows Up"**
Discusses differential linearity, the difference in analog output for a change between two successive digital input codes. Gives graphs of two examples with the same linearity specification.
Burr-Brown AN-58 (2 pg.)

13 **"Don't Forget D/A Converter Tempco"**
Discusses offset, gain and linearity drift with temperature.
Burr-Brown AN-59 (3 pg.)

14 **"Principles of Data Acquisition and Conversion"**
Discusses basic principles of analog to digital systems including sampling rate, aperture error, accuracy, resolution, throughput, and codes.
Burr-Brown AN-79 (5 pg.)

15 **"Squeeze High Performance Out of Low-Cost Hybrid Data Converters"**
Lists ways in which converter performance can be improved by the addition of a few external components.
Burr-Brown AN-86 (4 pg.)

16 **"What Designers Should Know About Data-Converter Drift"**
Examines components of drift as they apply to A/D and D/A converters. Includes discussion of the effect of reference drift and computation of worst case error.
Burr-Brown AN-89 (4 pg.)

17 **"Intrinsically Safe Data Acquisition"**
See listing under (Digital) CMOS (Burr-Brown)

18 **"FX-209 AP Notes"**
(FX-209)
Describes use of the FX-209 delta modulation analog to digital converter as an AGC amplifier, audio delay line and as an audio scrambler.
CMA (6 pg.)

19 **"Graphs Give Aperture Time Required for A-D Conversion"**
Presents two graphs, aperture time versus rate of voltage change and versus frequency, for resolutions from 4 to 16 bits.
Datel Technical Note V-14 (4 pg.)

©IC MASTER 1979

LINEAR

Converters (cont)

1 **"Know Your Converter Codes"**
Describes the various A/D and D/A converter codes.
Datel Bulletin V-12 (6 pg.)

2 **"Designer's Guide to V/F Converters"**
Spells out the theory and operation of V/F and F/V converters. Calibration procedures and such applications as ratiometric measurement and frequency difference measurement are covered.
Datel (18 pg.)

3 **"Applications of the ZN425E 8-Bit A-D/D-A Converter"**
(ZN425)
Covers converter definitions, calibration, bipolar operation. Applications: ramp generation, peak detect, channel selection, weighing system, bargraph drive, multiply/divide, and function generation.
Ferranti (31 pg.)

4 **"Digital-to-Analog Converter Applications"**
(HI1080, HI1085)
Operating modes and applications of HI-1080 converter, which features resistor ladder network and switching devices on same chip. Discusses cascaded D to A converter as well as up-down counter and successive approximation A to D converters.
Harris Application Note 511 (7 pg.)

5 **"Counter Type A to D Converter"**
(HI1080)
Circuit details of an A to D converter employing a unidirectional digital counter and the HI-1080 eight-bit D to A converter to generate a ramp voltage.
Harris Application Note 512 (3 pg.)

6 **"Data Conversion Handbook"**
Defines the qualities, specifications, and techniques that combine to give D/A and A/D converters their special character. Also covers sample/hold amplifiers, multiplexers, and coding.
Hybrid Systems $1.50 (175 pg.)

7 **"Applications of a Monolithic Sample-and-Hold/Gated Operational Amplifier"**
See (Linear) Amplifiers, Operational (Harris)

8 **"A-8400 User Guide"**
(A8400)
Theory, circuit details, operation, and design examples of this v/f and f/v converter.
Intech/FMI (18 pg.)

9 **"A-8402 User Guide"**
(A8402)
Theory, circuit details, operation, and design examples of this v/f and f/v converter.
Intech/FMI (30 pg.)

10 **"Digital-to-Analog Converter Circuits Using the 8018A"**
(ICL8018A, ICL8019A, ICL8020A)
Discusses D/A converters, both in general and their electrical specifications. Describes circuit operation for 8018A and covers its expansion to 8 and 12 bit units. Also discusses generating reference currents using zeners, pnp transistors or high-gain operational amplifiers as references. Describes system interface requirements.
Intersil Application Bulletin A010 (8 pg.)

Converters (cont)

11 **"8052A/8053A — A Low Cost Precision Pair for A/D Converters"**
(ICL8052, ICL8053)
Discusses the characteristics of the 8052/8053 dual pair and how they can be interfaced with one another to implement a dual-slope converter design.
Intersil A014 (30 pg.)

12 **"Selecting A/D Converters"**
Compares and contrasts successive approximation and integrating A/D conversion techniques with respect to speed, accuracy, and cost.
Intersil A016 (6 pg.)

13 **"The Integrating A/D Converter"**
Discusses the dual slope technique with considerable attention to error analysis.
Intersil A017 (4 pg.)

14 **"Do's and Don'ts of Applying A/D Converters"**
Examines topics concerning proper system design when using A/D converters. Subjects treated include ground loop errors, components, references, capacitive coupling, and thermal effects.
Intersil A018 (2 pg.)

15 **"Power D/A Converters Using the IH8510"**
(IH8510, AH8520, IH8521, 7105, 7120)
Discusses the addition of a power amplifier to a D/A converter. Briefly describes use for motor control and programmable power supplies.
Intersil A021 (4 pg.)

16 **"The ICL7104 — A Binary Output A/D Converter for μ Processors"**
(ICL7104, ICL8052, ICL8068)
Describes the operation of the ICL7104, and either the ICL8052 or ICL8068, as a dual-slope integrating converter.
Intersil A030 (14 pg.)

17 **"Voltage Transients (Glitches)"**
(MN3008)
Discusses D/A converter analog voltage spikes appearing in the output following a change of input code.
Micro Networks AN-101 (2 pg.)

18 **"Truncation of A/D Converters"**
Describes how to reduce or to program the number of bits converted.
Micro Networks AN-102 (2 pg.)

19 **"When Should a Sample Hold Amplifier be Used?"**
Covers the use of sample-hold amplifiers with A/D converters. Discusses use with dynamically changing signals and the droop rate of the sample-hold circuit.
Micro Networks AN-103 (2 pg.)

20 **"MN312 Connections for Bipolar Output"**
(MN312)
Shows use of an external op amp to convert a unipolar output to bipolar.
Micro Networks AN-104 (2 pg.)

21 **"Serial to Parallel Conversion"**
(MN502, MN5200, MN5210)
Covers timing considerations in the conversion of A/D converter output from serial to parallel form.
Micro Networks AN-106 (2 pg.)

LINEAR

Converters (cont)

1 **"Simplifying the Digital to Analog Converter through Hybrid Technology"**
Considers basic design problems of D/A converters and gets into hybrid design. Includes construction techniques, specifications and testing.
Micro Networks (10 pg.)

2 **"Build a Low Cost Data Acquisition System with Standard DIPs"**
(MN7130, MNADC80)
Shows how a complete 12-bit, 16-channel data acquisition system can be built by adding a few standard ICs to the MN7130 multiplexed sample/hold amplifier.
Micro Networks AN201 (6 pg.)

3 **"Analog-to-Digital Conversion Techniques"**
Discusses open-loop and feedback techniques: frequency, pulse width, cascade, ramp, counter, successive approximation, multiple comparison subranging, nonlinear conversion, double and triple ramp conversion.
Motorola AN-471 (21 pg.)

4 **"Analog-to-Digital Cyclic Converter"**
(MC1456)
Discusses circuits and operation of medium speed-medium accuracy converter that uses successive approximation technique in which unknown analog input voltage is successively compared to reference voltage to determine each bit of digital output. A comparison of gray and binary code operation and an error analysis are provided.
Motorola AN-557 (10 pg.)

5 **"A Single Ramp Analog-to-Digital Converter"**
Discusses an A/D converter which incorporates a calibration cycle to insure 12 bit accuracy. Briefly covers errors encountered in the converter described.
Motorola AN-559 (9 pg.)

6 **"High Speed Digital-to-Analog and Analog-to-Digital Techniques"**
Gives overview that includes voltage and current output D/As; parallel (flash), tracking, successive approximation, and parallel ripple A/Ds as well as nonsynchronous and synchronous VTF A/D. Glossary of terms.
Motorola AN-702 (14 pg.)

7 **"Binary D/A Converters Can Provide BCD-Coded Conversion"**
(MC1408, MC1508)
Describes the MC1508 D/A converter used as a 2 or 2½ digit BCD converter. Describes application in a 2½ digit digital voltmeter.
Motorola AN-713 (4 pg.)

8 **"Successive Approximation A/D Conversion"**
(MC1408, MC14559)
Describes advances in successive approximation techniques with emphasis on SARs (Successive Approximation Registers.) Shows both a normal and a high speed A/D using these methods.
Motorola AN-716 (8 pg.)

9 **"Autoranging Digital Multimeter Using the MC14433 CMOS A/D Converter"**
(MC14433)
Describes using the MC14433 A/D converter to build an autorange digital multimeter. The multimeter includes ac and dc voltage ranges from 200mV to 200V, ac and dc current from 2mA to 2A full scale, and resistance ranges from 2 kilohms to 2 megohms full scale.
Motorola AN-769 (5 pg.)

Converters (cont)

10 **"Data Acquisition Networks with NMOS and CMOS"**
See listing under (Microprocessors) Applications (Motorola)

11 **"Analog-to-Digital Conversion Techniques with the M6800 Microprocessor System"**
See listing under (Microprocessor) Systems (Motorola)

12 **"Applications of the MC1405/MC14435 in Digital Meters"**
See listing under (Linear) Instrumentation (Motorola)

13 **"Digital Voltmeters and the MM5330"**
(MM5330)
Describes basic counting techniques for building digital voltmeters and shows how the MM5330 can be used in a dual slope system.
National AN-155 (8 pg.)

14 **"Specifying A/D and D/A Converters"**
Explains and defines the data sheet terms for these converters.
National AN-156 (6 pg.)

15 **"Data Acquisition System Interface to Computers"**
(ADC1200, ADC1210, MM5357)
Compares three configurations for multiple input analog to digital converter systems—Random Addressed Multiplexed, Parallel Conversion, and Multiplexed with Memory. Gives detailed comparisons of costs, A/D and interface requirements.
National AN-159 (18 pg.)

16 **"Analog-to-Digital Converter Testing"**
(ADC0800, ADC1210, ADC1211)
Describes a low cost test circuit with board layout for testing A/Ds using a storage scope readout.
National AN-179 (6 pg.)

17 **"A Cheap and Easy DC-DC Converter"**
(LM555)
Design equations, derivations, and schematics used to construct a DC-DC converter.
National AN-183 (4 pg.)

18 **"High Speed Warning Device for Automobiles"**
Proposes a tachometer device operating from the spark coil primary.
National Linear Applications Handbook, Vol. II, LB-33 (2 pg.)

19 **"CMOS A/D Converter Chips Easily Interface to 8080A Microprocessor Systems"**
(ADC3511, ADC3711, INS8080A)
Outlines techniques for interfacing AID converter devices to 8080A μP systems. Includes description of A/D conversion, BCD output capability, flowcharts, schematics, and block diagrams.
National AN-200 (9 pg.)

20 **"Application Circuits of μPC603D, 610D"**
(μPC603, μPC610)
Discusses functions and operating principles of each device as well as applications including a digitally programmable power source and a waveform generator.
NEC America IEP-543 (24 pg.)

21 **"Application Information for μPC614D"**
(μPC614)
Provides application hints and parameters for a pulse width modulation converter in a digital multimeter application.
NEC America (6 pg.)

©IC MASTER 1979

LINEAR

Converters (cont)

1 **"The SP750 in A/D Converters"**
(SP750)
Describes a parallel A/D converter using the device. Diagrams and device characteristics are included.
Plessey (8 pg.)

2 **"Strobing the DAC-08 Under Logic Control"**
(DAC-08)
Gives connections for strobing the output of this DAC.
Precision Monolithics AB-1 (1 pg.)

3 **"A Low Cost, High-Performance Tracking A/D Converter"**
(DAC-100, CMP-01)
Basic operation of 8-bit tracking converter that uses DAC-100 series 10-bit D/A converter, CMP-01 series comparator, and 4-bit MSI up/down counters.
Precision Monolithics AN-6 (8 pg.)

4 **"A Low Cost, Easy-to-Build Successive Approximation Analog-to-Digital Converter"**
(DAC-100, CMP-01)
General discussion of feedback A/D converters. Operation of A/D converter capable of 8-bit conversions in 6 μs. The system is expandable to 10-bit resolution. It uses DAC-100, CMP-01, and a successive approximation register.
Precision Monolithics AN-11 (8 pg.)

5 **"Interfacing Precision Monolithics Digital-to-Analog Converters with CMOS Logic"**
(DAC-100, DAC-01)
Analyzes input circuits of these DACs and CMOS interfaces. Describes a complete 10-bit DAC and an 8-bit A/D.
Precision Monolithics AN-14 (4 pg.)

6 **"Low Cost, High Speed Analog-to-Digital Conversion with the DAC-08"**
(DAC-08)
Discusses the successive approximation technique to A/D and describes three designs with conversion times of 1, 2, and 4 μsec.
Precision Monolithics AN-16 (7 pg.)

7 **"DAC-08 Applications Collection"**
(DAC-08)
Discusses the dual output, and high compliance. Covers use in a CRT display driver, bridge transducer control system, A/D converter, waveform generator, digital additions/subtraction with analog output, digital attenuator and microprocessor controlled A/D converter.
Precision Monolithics AN-17 (12 pg.)

8 **"Differential and Multiplying Digital-to-Analog Converter Applications"**
(DAC-08)
Describes use in 2-quadrant, 4-quadrant and AC-coupled multiplication. Also covers differential and ratiometric conversion, a nulling bridge circuit, a power monitor, and algebraic computation circuits with analog output.
Precision Monolithics AN-19 (8 pg.)

9 **"Exponential Digitally Controlled Oscillator Using DAC-76"**
(DAC-76)
Depicts a 4-IC microprocessor-controlled oscillator with a 8159 to 1 frequency range covering 2.5 Hz to 20 kHz. The circuit uses an exponential current output D/A converter as a programmable current source.
Precision Monolithics AN-20 (3 pg.)

Converters (cont)

10 **"3 IC 8-Bit Binary Digital to Process Current Converter with 4-20 mA Output"**
(REF-01, DAC-08, OP-14)
Delineates the construction of a process current converter operating from −5v and 23v supplies. Complete theory of operation followed by calibration procedures and a detailed parts list are included.
Precision Monolithics AN-21 (2 pg.)

11 **"Software Controlled A/D Conversion Using DAC-08 and the 8080A Microprocessor"**
(DAC-08, 8080A)
Describes software controlled, 8-bit A/D conversion using the DAC-08 and the 8080A. Subjects include I/O interface considerations, I/O control using memory mapping, and a successive approximation A/D conversion algorithm.
Precision Monolithic AN-22 (4 pg.)

12 **"D/A Converter Generates Hyperbolic Functions"**
(DAC-20)
Explains operating theory and design considerations of a two IC hyperbolic function generator. Includes circuit diagrams.
Precision Monolithics AN-23 (3 pg.)

13 **"Low Cost Four Channel DAC Gives BCD or Binary Coding"**
(DAC-08, DAC-20)
Describes the construction of a four-channel digital-to-analog converter using four multiplying DACs, a precision quad op amp, a system IC voltage reference, and a DIP-packaged thin-film resistor network.
Precision Monolithics AN-26 (4 pg.)

14 **"IC F/V Converters Readily Handle Other Functions, Such as F/V, A/D"**
(RC4151, RM4151)
Describes use of the 4151 as an F/V converter, a V/F converter, and an FSK demodulator.
Raytheon Semiconductor Application Note (6 pg.)

15 **"Digital-to-Analog Conversion Using the RCA CD4007A COS/MOS IC"**
(CD4007A)
Discusses resistance networks for DAC's and a voltage-follower amp for single-supply operation. Describes a 9-bit COS-MOS DAC.
RCA ICAN-6080 (6 pg.)

16 **"The 4151 Voltage to Frequency Converter"**
(RC4151, RM4151, RV4151)
Describes various uses of this v/f and f/v converter.
Raytheon Semiconductor Application Note (8 pg.)

17 **"Function and Application of 3½ Digit A/D Converter Set"**
(LD110, LD111)
Describes the operation of the LD110 digital processor and the LD111 analog processor. Various DVM circuits are shown including circuits for ratio, current, ac voltage and frequency measurements. A detailed error analysis is provided.
Siliconix AN74-1 (12 pg.)

18 **"More Applications of the LD110/LD114 ±3½ A/D Converters"**
(LD110, LD111, LD114)
Provides circuits to construct LCDs, multiplexed displays, gas discharge displays, and a DC-DC converter. Also details the differences between the LD110 and LD114.
Siliconix AN76-4 (8 pg.)

Converters (cont)

1 **"Applying the LD130 ± Digit A/D Converter"**
(LD130)
Discusses device features and its use in displays, interface, and instrumentation.
Siliconix AN76-5 (16 pg.)

2 **"Solve Your Measurement Problems"**
Discusses v/f and f/v converters and their use in data acquisition problems.
Teledyne Philbrick AN-20 (6 pg.)

3 **"Designing High Speed Data Acquisition Systems"**
Discusses the basics of data acquisition systems; focusing on sample-and-hold circuits and multiplexer modules.
Teledyne Philbrick AN-21 (12 pg.)

4 **"How to Specify and Test Voltage to Frequency and Frequency to Voltage Converters"**
Defines device parameters, specifications, and test techniques.
Teledyne Philbrick AN-22 (4 pg.)

5 **"Specifying and Testing Analog-to-Digital Converters"**
Defines the basic parameters, specifications, and test methods.
Teledyne Philbrick AN-24 (7 pg.)

6 **"Specifying and Testing Digital-to-Analog Converters"**
Defines basic parameters, specifications and test methods.
Teledyne Philbrick AN-25 (7 pg.)

7 **"Repetitive Mode Operation for Models 4109/4111 Integrating A/D Converters"**
(4109, 4111)
Runs through external trigger generator and sure start circuit schemes which are used when the devices must run without ceasing to convert.
Teledyne Philbrick AN-28 (2 pg.)

8 **"Specifying and Testing Sample-Hold Amplifiers"**
Defines various sample-hold amplifier parameters and outlines methods of testing for them.
Teledyne Philbrick AN-30 (5 pg.)

9 **"Modular V/F's and F/V's: Simple Solutions to Everyday Conversion Problems"**
Examines applications of V/F's and F/V's. Also demonstrates how accuracy can be improved with the addition of more components.
Teledyne Philbrick AN-32 (7 pg.)

10 **"Applications of the 8700 Series A/D Converters"**
(8700)
Supplies diagrams showing interface to autoranging circuits, to gas discharge displays, and to two independent displays, operated from one A/D.
Teledyne Semiconductor AN-9 (16 pg.)

11 **"Applications for the 9400 Voltage to Frequency/ Frequency to Voltage Converter"**
(9400)
Contains 25 block diagrams of applications in which the device is used.
Teledyne Semiconductor AN-10 (8 pg.)

Drivers

12 See also (Digital) Interface

13 **"Interfacing and Level-Shifting with the MEM4900"**
(MEM4900)
Describes device and application in a TTL to MOS interface buffer, a data selector, analog signal multiplexing, and an A/D de-multiplexer.
General Instrument Bulletin 1603 (3 pg.)

14 **"CMOS Line Drivers"**
States reasons for using CMOS line drivers.
National AN-158 (4 pg.)

15 **"Driving Burroughs' Bar Graph Display"**
Shows the use of comparators and flip-flops to drive these displays.
National DB-4 (2 pg.)

16 **"MOS Clock Drivers"**
(MH0007, MH0009, MH0012, MH0013)
Lists the characteristics of various MOS clock drivers and how they differ in their input stages.
National MB-9 (2 pg.)

17 **"PIN Diode Drivers"**
See listing under (Linear) Switches. (National)

18 **"Driver Circuits for the JFET Analog Switch"**
See listings under (Linear) Switches. (Siliconix)

19 **"Logic to Power Converter Circuits"**
(400-series, 500-series)
Covers the operation of the 400 and 500 high current driver series.
Sprague Electric TP 71-3 (6 pg.)

Followers

20 **"A Fast Integrated Voltage Follower with Low Input Current"**
(LM102)
Circuit description. Use of the LM102 for analog commutator, sample and hold ac amplifier and active filter applications.
National Linear Applications Handbook, Vol. I, AN-5 (11 pg.)

21 **"The LM110 — An Improved IC Voltage Follower"**
(LM110, LM210, LM310)
Compares LM102 and LM110 circuits. Shows diagrams of LM110 as a high pass active filter, high Q notch filter, bandpass filter, and low drift sample and hold circuit.
National Linear Applications Handbook, Vol. I, LB-11 (2 pg.)

22 **"Monolithic Operation Amplifiers — The Universal Linear Component"**
See (Linear) Amplifiers, Operational (National)

23 **"Applications for a New Ultra-High Speed Buffer"**
(LH0033, LH0033C)
Describes LH0033 fast voltage follow/buffer. Applications; high speed dual limit comparator for MOS logic, instrumentation shield/line driver, high speed sample and hold circuit, 4.5 MHz notch filter, high input impedance AC coupled amplifier, output buffer.
National AN-48 (4 pg.)

©IC MASTER 1979

LINEAR

General

1 "Nonlinear Circuits Handbook"
Covers principles, circuits, performance, specifications, testing and applications for multipliers, dividers, squares, log circuits, multifunction and rms-to-dc converters.
Analog Devices $5.95 (535 pg.)

2 "Function Circuits, Design and Applications"
Covers design theory and applications for such analog functions as multipliers, dividers, logarithmic amplifiers, exponentiators, RMS converters, and active filters. Includes notes on specifying and testing these functions.
Burr-Brown $21.00 (300 pg.)

3 "Intrinsically Safe Data Acquisition"
See listing under (Digital) CMOS (Burr-Brown)

4 "Custom IC Design Using I^2L Technology"
See (Digital) I^2L (Exar)

5 "Radiation Testing of Linear Microcircuits"
(μA702, μA709, μA710, μA711)
Describes tested performance of μA702 and μA709 operational amplifiers and μA710 and μA711 comparators after having been irradiated with fast neutrons of energies greater than 0.01 MeV.
Fairchild Application Note 195 (13 pg.)

6 "Using the MEM4962 Smoke Detector IC"
(MEM4962)
Describes the device and provides two exemplary applications in smoke sensing circuits.
General Instrument Bulletin 0601 (3 pg.)

7 "Alarm Circuit"
(MONOCHIP)
Discusses an alarm sensing circuit capable of driving a loud speaker or LED or triggering a logic level. The design and performance is described in detail, including all component values, layout and characteristics over the military temperature range.
Interdesign APN-1 (7 pg.)

8 "IC Crystal Oscillators"
(MONOCHIP)
Covers crystal oscillator basics and interfacing them with device.
Interdesign APN-4 (3 pg.)

9 "Rectifier Circuits for Linear IC's"
(MONOCHIP)
Discusses techniques for designing rectifiers using the components available on semicustom IC's. Design precautions are examined in detail and illustrative diode, peak detector, and averaging rectifier circuits are presented.
Interdesign APN-6 (7 pg.)

10 "Integrated High Speed Operational Amplifier"
(MONOCHIP)
Explains how modern high speed, high stability circuits can be constructed using semicustom IC technology. A representative op amp with a bandwidth of 40 MHz and an open loop gain of 10,000 is presented.
Interdesign APN-7 (7 pg.)

11 "Computer Analysis of Linear Semicustom IC's"
(MONOCHIP)
Describes a computer aided design program jointly developed by Interdesign and UCC. Illustrates the use of this program by analyzing a high performance integrated phase-locked loop.
Interdesign APN-12 (6 pg.)

General (cont)

12 "Solid State Gas/Smoke Detector Systems"
Describes semiconductor and ionization chamber systems with some discussion of the use of these with CMOS ICs.
Motorola AN-735 (9 pg.)

13 "Noise Sources"
Reviews noise basics. Includes discussion of resistive, capacitive, and inductive noise sources.
National FET Databook (3 pg.)

14 "The Noise Figure Fallacy"
Describes problems of defining and calculating the noise figure.
National FET Databook (2 pg.)

15 "Linear Applications, Vol. 1"
Feb. 1973, includes National application notes (AN) 1-6, 8, 10, 13, 15, 20, 21, 23, 24, 28-34, 38, 41, 42, 46, 48, 49, 51, 53, 54, 56, 63, 64, 69-72, 74, 75 and Linear Briefs (LB) 1-20, individually described elsewhere.
National $4.00 (432 pg.)

16 "Linear Applications, Vol. 2"
Includes National application notes (AN) 79, 81, 82, 87, 88, 97, 103, 104, 110, 115, 116, 125, 129, 132, 146, 147, 151, 153, 154, 156, 161, 162 and Linear Briefs (LB) 21-34, individually described elsewhere.
National $4.00 (256 pg.)

17 "CMOS Linear Applications"
See listing under (Digital) CMOS (National)

18 "Constant Current LED"
See listing under (Linear) Regulators (National)

19 "Surface Acoustic Wave Technology"
Presents surface acoustic wave fundamentals and use in delay lines, pulse compression filters, bandpass filters, oscillators and discriminators.
Plessey Semiconductor (10 pg.)

20 "Polarity Programmable Peak Detector"
Details a circuit that gives positive or negative peak detection and reset levels over a $\pm$10 V range.
Precision Monolithics AN-27 (2 pg.)

21 "Solid-State Devices Manual"
Provides tutorial information on discrete devices and ICs, with emphasis on consumer, hobbyist and experimenter applications.
RCA SC-16 $5.00 (750 pg.)

22 "Linear Integrated Circuits"
Basic circuit elements, fabrication, packaging, and interconnection techniques are discussed. Data and application information on RCA linear IC's is included.
RCA IC-43 $2.50 (416 pg.)

23 "Criteria for Choosing Resins and Evaluation Tests for Discrete and Integrated Power Devices in Plastic Packages"
Describes the criteria and experimental procedures used in the choosing of moulding resin for plastic packaged devices.
SGS-ATES Technical Note 132 (15 pg.)

LINEAR

Industrial Control

1 **"Electronic Controller with an Equilibrium Sustaining Mode"**
(3500 series)
Discusses a controller formed with two operational amplifiers in a pulse width modulation circuit with feedback. The feedback operates from a heater through the medium being heated to sense amplifiers.
Burr-Brown AN-63 (2 pg.)

2 **"Sequential Industrial Control Using the IM5200 FPLA"**
(IM5200)
Describes theory and advantages of using this FPLA. Example included.
Intersil Application Bulletin MB0001 (6 pg.)

3 **"Variable Speed Control System for Induction Motors"**
(MC673, MC688)
Describes control scheme implemented with discrete components and IC logic coupled by an LED and a photo transistor. Gives example of a circuit used to drive a Class F, 60 Hz, permanent-split, capacitor induction motor with a 13 oz. in. load rating.
Motorola AN-575A (5 pg.)

4 **"A ROM-Digital Approach to PWM-Type Speed Control of AC Motors"**
Describes a pulse width modulation scheme to control motor speed. Shows a CMOS-ROM system to provide variable frequency drive for 1, 2, or 3 phase motors.
Motorola AN-733 (12 pg.)

5 **"A Variable Frequency Control for 3ϕ Induction Motors"**
Describes a variable frequency, variable voltage drive system for 3-phase induction motor controls.
Motorola AN-766 (10 pg.)

6 **"Temperature Measurement Method Based on Matched Transistor Pair Requires No Reference"**
(MAT-01, OP-10)
Discusses properties of matched transistor pairs, then describes temperature measuring systems built with a matched pair, constant current sources, and a differential amplifier (OP-10)
Precision Monolithics AN-12 (8 pg.)

7 **"TCA600/900 and TCA610/910 Integrated Motor Speed Regulators"**
(TCA600, TCA610, TCA900, TCA910)
Introduces speed regulator basic and describes device performance. Portable and car mounted applications are depicted.
SGS-ATES Technical Note 113 (10 pg.)

8 **"Signetics Analog Manual"**
(μA723, LM381, LM382, MC1488, MC1489, MC1496, PA239, ULN2111, 521, 522, 526, 529, 540, 542, 550, 555, 560, 561, 562, 565, 566, 567, 592) Covers linear IC processing and design, operation amplifier characteristics and applications, voltage regulators, interface circuits, timers, communications circuits, consumer circuits, phase locked loops, telecommunication circuits and data sheets (321 pg.)
Signetics $7.00 (916 pg.)

Instrumentation

Also see Converters

Instrumentation (cont)

9 **"Application Notes AN-205"**
(FX205)
Describes use of the FX205 pseudo sinewave generator as a tone generator, tone-burst generator, a divide by eight sinewave source and an fsk generator.
Consumer Microcircuits of America AN-205 (16 pg.)

10 **"A Universal Sinewave Converter Using the XR2208 and XR2211"**
(XR2208, XR2211)
A circuit technique is described which can convert any periodic waveform into a low-distortion sinewave. The circuit operation is completely independent of input waveform amplitude and frequency as long as the input signal is periodic and can operate over a frequency range of 1 Hz to 100 kHz.
Exar AN-11

11 **"A Complete Function Generator System Using the XR2206"**
(XR2206)
A self contained function generator system is described, using the device. Complete circuit connection diagram, parts list and assembly instructions are given for a DC to 100 kHz self-contained function generator system with AM/FM capability and triangle, sine and square wave output.
Exar AN-14

12 **"A Simple Digital Voltmeter Using the AY5-3500 DVM Circuit"**
(AY5-3500)
Gives the schematics for the digital and analog circuitry needed to build a voltmeter with a $\pm$1.999 V full scale reading and capable of driving a 0.4" common anode LED display. Options available with minor modifications include BCD outputs, display hold, measurement initiate, and additional ranges of $\pm$0.999 V or $\pm$2.999 V.
General Instrument Bulletin 0901 (3 pg.)

13 **"A Deep Freeze Digital Thermometer Using the AY5-3500 DVM Circuit"**
(AY5-3500)
Provides circuit diagrams for a 0 to -30°C thermometer using a negative temperature coefficient thermistor as the sensing element and an AY5-3500 as the measuring and display device.
General Instrument Bulletin 0902 (3 pg.)

14 **"A Digital Thermometer Using the AY5-3507 Circuit"**
Supplies description and schematic for a -20 to 50°C (-4 to 122°F) thermometer that will display temperature in Farenheit or Centrigrade.
General Instruments Bulletin 0903 (2 pg.)

15 **"A Digital Voltmeter Using the AY-5-3507"**
(AY5-3507)
Gives schematics for the analog section, reference voltage generator, clock oscillator, and display circuitry required in addition to this logic IC to build a 3½ digit voltmeter.
General Instrument Microelectronics (5 pg.)

16 **"Waveform Generator"**
(MONOCHIP)
Describes using two of the devices in a wave form generator application that produces sine, triangle, and square wave outputs. Provides schematics and a discussion of performance.
Interdesign APN-8 (10 pg.)

©IC MASTER 1979

LINEAR

Instrumentation (cont)

1 **"A Precision Waveform Generator and Voltage Controlled Oscillator"**
(ICL8038)
Discusses the 8038 circuit and operation. Covers external adjustments, power-supply connections, frequency modulation, sweeping, and use in phase locked loops.
Intersil Application Bulletin A012 (8 pg.)

2 **"Everything You Always Wanted to Know About the 8038"**
(ICL8038)
Presents answers to the most frequently asked questions about the 8038 function generator and its applications.
Intersil A013 (4 pg.)

3 **"4½ Digit Panel Meter Demonstrator/Instrumentation Boards"**
(ICL8052A, ICL7103A)
Describes two versions of the complete circuit for a 4½ digit DPM with ±2.000 V full scale and LED readout.
Intersil A019 (8 pg.)

4 **"Low Cost Digital Panel Meter Designs"**
(ICL7106, ICL7107)
Supplies complete assembly instructions for Intersil's LCD and LED evaluation kits as well as descriptions of individual components.
Intersil A023 (6 pg.)

5 **"Building an Auto-Ranging DMM with the ICL7103A/8052A A/D Converter Pair"**
(ICL7103A, ICL8052A, ICL8007)
Describes the design and operation of two 10 μV resolution, 4½ digit auto-ranging DMMs using the 7103A/8052A pair.
Intersil A028 (6 pg.)

6 **"The Integrating A/D Converter"**
See (Linear) Converters (Intersil)

7 **"Instrumentation Amplifiers — They're Great Problem Solvers When Correctly Applied"**
(MN2200)
Covers basic operation and application considerations for instrumentation amplifiers.
Micro Networks AN202 (4 pg.)

8 **"A 3½ Digit DVM Using an Integrated Circuit Dual Ramp System"**
(MC1405, MC14435)
Describes a complete digital voltmeter based on the MC1405/14435 device pair. Includes input buffers and autopolarity.
Motorola AN-746 (6 pg.)

9 **"Applications of MC1405/MC14435 in Digital Meters"**
(MC1405, MC14435)
Provides a detailed applications reference for this two chip, dual slope A/D converter system.
Motorola AN-748 (18 pg.)

10 **"Solid State Altimeter for Transponder Applications"**
(LX3702)
Describes a solid state altimeter using a pressure transducer. The unit provides an altitude transmission code for use with transponders, plus digital readout.
National AN-109 (8 pg.)

Instrumentation (cont)

11 **"Wide Range Function Generator"**
Construction of a function generator for sine waves as well as square and triangular waveforms that operates below 10 Hz up to 1 MHz, with usable output to approximately 2 MHz. Design technique, circuit design, and construction directions.
National AN-115 (4 pg.)

12 **"Dual Polarity 3½ Digit DVM Realized with Simple CMOS Interface"**
(ADC3711, LF11300)
Describes an auto-zero, auto-polarity 3½-digit DVM using the LF-11300 and the MM74C928 (ADC3711).
National AN-165 (2 pg.)

13 **"LM2907, LM2917 Tachometer/Speed Switch Building Block Applications"**
(LM2907, LM2917)
Covers basic circuit and use. Applications illustrated include: speed switch, analog display driver, automotive tachometer, motor speed controls, skid sensor, A/D converter, frequency doubler.
National Linear Applications Handbook, Vol. II, AN-162 (16 pg.)

14 **"RMS Converters and Their Applications"**
(LH0091)
Covers RMS converter basics and specifications. Sketches applications including spectrum analysis, harmonic distortion, noise, vibration analysis, and DVM uses.
National AN-180 (4 pg.)

15 **"A Digital Multimeter Using the ADD3501"**
(ADD3501)
Describes a 3½ digit multimeter capable of measuring ac and dc voltages, currents and resistance with the device. Includes circuit diagram.
National Semiconductor AN-202 (4 pg.)

16 **"A Fully Differential Input Voltage Amplifier"**
(LM3900)
Describes operation of instrumentation amplifier built with LM3900. Also shows how a transducer bridge amplifier system can be developed with LM3900.
National Linear Applications Handbook, Vol. I, LB-20 (2 pg.)

17 **"Precise Tri-Wave Generation"**
(LM118, LM119)
Describes triangle-wave generator consisting of the LM118 integrator and two LM119 comparators. Discusses applications including VCO, regulator and operational amplifier testing.
National Linear Application Handbook, Vol. II, LB-23 (2 pg.)

18 **"3½ Digit DVM Demonstrator Board"**
(LD110, LD111)
Supplies the schematics, parts-list and art-work for a DVM demonstrator board.
Siliconix DA74-1 (4 pg.)

19 **"LD130 ±3 Digit DVM Demonstrator Board"**
(LD130)
Presents a DVM circuit and the PC board layout used to build a demonstrator board.
Siliconix DA76-2 (2 pg.)

20 **"Build an Autoranging DMM with the LD130 A/D Converter"**
(LD130)
Discusses the construction of a DMM using this device.
Siliconix DA76-3 (7 pg.)

LINEAR

Instrumentation (cont)

1 **"Build a Portable 0 to 99.9°F Liquid Crystal Display Thermometer"**
(DF411, LD130)
Furnishes all pertinent equations, component lists, schematics, and the PC foil pattern need to build a battery operated thermometer.
Siliconix DA77-1 (4 pg.)

2 **"LD120/LD121 4½ Digit DVM"**
(LD120, LD121)
Details construction of a DVM using these devices.
Siliconix DA77-2 (4 pg.)

3 **"A Fully Integrated Motion Detector"**
(ULN-2232)
Discusses circuit, system layout, and basic operation of a fully integrated motion detector for use in security systems, video games, and toys.
Sprague TP78-4 (9 pg.)

4 **"EPN2100 Thermal Printer"**
(EPN2100)
Detailed discussion of this solid state thermal printer and its interface requirements.
Texas Instruments Application Report CA-163 (6 pg.)

5 **"EPN2500 Thermal Printer"**
(EPN2500, SN74492, SN74495, TMS2502)
Discusses this thermal printer and its interface requirements. Includes a description of the SN75495 Row Driver and the SN75492 Digit Driver to interface the printhead to MOSFET logic circuits, and the TMS2502 character generator for providing alphanumeric characters.
Texas Instruments Application Report CA-175 (10 pg.)

Modulators

6 **"MC1596 Balanced Modulator"**
(MC1496, MC1596)
Describes device operation and applications, including modulators and demodulators for AM, SSB, and suppressed carrier AM, frequency doublers; and HF/VHF double balanced mixers.
Motorola AN-531 (12 pg.)

7 **"Simplifying Converter Design with a New Integrated Regulating Pulse Width Modulator"**
(SG1524, SG2524, SG3524)
Describes various functions within the device and describes such applications as a low current polarity converter, a DC to DC converter, and a +5 to ±15V flyback converter.
Silicon General (7 pg.)

8 **"Deadband Control with the SG1524 Regulating Pulse Width Modulator Circuit"**
(SG1524, SG2524, SG3524)
Discusses techniques to control the amount of deadband in push-pull inverter applications.
Silicon General Linear Brief 6 (1 pg.)

Multipliers

9 **"Multiplier Application Guide"**
(AD530, AD531, AD532, AD533, AD534, AD536)
Explains multiplier basics, upkeep, and use in a variety of applications including instrumentation functions, signal generators and filters, and to augment the performance of other circuits.
Analog Devices (40 pg.)

Multipliers (cont)

10 **"AD530 Complete Monolithic Multiplier, Divider, Square Rooter"**
(AD530)
Describes the device, its circuit, external connections and adjustments. Applications include use in a precision rectifier, a phase sensitive demodulator, an automatic level control, a voltage controlled filter, a voltage controlled oscillator, an amplitude modulator and a frequency discriminator.
Analog Device Technical Bulletin (11 pg.)

11 **"A Practical Guide to Applying IC Multipliers"**
Describes theory, gives definitions, covers use in dividers, squares, vector summation, rms to dc conversion, 2ϕ oscillator, and balanced modulators.
Analog Devices (11 pg.)

12 **"Reducing the Total Error of the AD530, AD531, AD532, and AD533 Multipliers"**
(AD530, AD531, AD532, AD533)
Describes method of empirically reducing errors using external resistors.
Analog Devices Application Brief (2 pg.)

13 **"Analog Modules Multiply User's Options"**
Discusses various types of multipliers, logarithmic converters, dividers and square rooters, peak detectors and comparing circuits. Applications: electron beam welder, 3-mode carriage control, position control, fog visionmeter, optical measuring system, and lab pressure standard.
Burr-Brown AN-55 (6 pg.)

14 **"A Primer on Analog Multiplier Specifications"**
Discusses dc and dynamic performance specifications, including output and input offset, gain error, linearity, small signal and full power frequency response, output slewing rate, and settling time.
Burr-Brown AN-51 (6 pg.)

15 **"Analog Shaping"**
(4301)
Describes the use of the 4301 multifunction circuit which has the transfer function XY/Z. Includes rms to dc conversion, exponentiation, trigonometric functions, vector computation, and use as a log amp.
Burr-Brown AN-70 (5 pg.)

16 **"Function Circuits, Design and Applications"**
See listing under (Linear) General (Burr-Brown)

17 **"A-8595 Operation and Applications Information"**
(A8495, A8595)
Reviews device theory and design. Applications include a basic multiplication circuit, a squaring circuit, and a divide circuit.
Intech/FMI (16 pg.)

18 **"Log/Lin Multiplier"**
(MONOCHIP)
Describes an IC multiplier which achieves low noise and distortion. Covers all phases of development from initial concept and breadboarding to integration in an audio sweep function generator.
Interdesign APN-3 (11 pg.)

19 **"Analysis and Basic Operation of the MC1595"**
(MC1495, MC1595)
Gives equations for the analysis of this linear four-quadrant multiplier and discusses characteristic performance. Covers multiplication, division, mean squares, square roots, roots and powers.
Motorola AN-489 (14 pg.)

©IC MASTER 1979

LINEAR

Multipliers (cont)

1 **"Wideband Amplifier/Multiplier"**
(SG1402)
Operation and applications of the SG1402. Describes use as a single-ended variable gain amplifier, a modulator, and a demodulator.
Silicon General Linear IC Product Guide (4 pg.)

2 **"Linear-Antilog Voltage Controlled Amplifiers"**
(SSM2000, SSM2020)
Discusses control circuits, voltage controlled amplifiers, and a four quadrant multiplier among other applications.
Solid State Music (9 pg.)

Phase Locked Loops

3 **"Precision PLL System Using the XR2207 and the XR2208"**
(XR2207, XR2208)
Defines phase locked loop parameters and describes this two-chip PLL system. Includes circuit interconnections for both single supply and split-supply operation. Also gives PLL design equations.
Exar AN-06 (6 pg.)

4 **"Sinusoidal Output from XR-215 Monolithic PLL Circuit"**
(XR215)
Discusses obtaining a sinusoidal output signal which is synchronized to a desired reference or clock output using the device. Provides schematics of device and application.
Exar AN-09 (2 pg.)

5 **"A Wide Tracking Range Precision PLL System Using the XR2212 and XR4151"**
(XR2212, XR4151)
A two-chip PLL system is described which offers extremely wide tracking range without harmonic locking.
Exar AN-12

6 **"The μA758, a Phase-Locked Loop FM Stereo Multiplex Decoder"**
See listing under (Linear) Consumer, AM/FM. (Fairchild)

7 **"Introduction to the Phase Locked Loop"**
(HA-2820)
General discussion of phase locked loops. Describes applications including a bandpass filter, FM receivers, data modems and synchronizers, a motor speed control, and a frequency synthesizer. Discusses features of HA-2800 and 2820 PLL.
Harris Application Note 601 (7 pg.)

8 **"A General Analysis of the Phase Locked Loop"**
Discusses a linear model, stability considerations and steady state response for phase locked loops.
Harris Application Note 602 (8 pg.)

9 **"The HA-2820/2825 Low Frequency Phase Locked Loop"**
(HA-2820, HA-2825)
Explains circuitry of these phase locked loops in 0.1 Hz to 3 MHz operation. Discusses methods for obtaining parameters of a linear model from device's performance curves. External connections are illustrated with an FM demodulator circuit.
Harris Application Note 605 (7 pg.)

10 **"MTTL and MECL Avionics Digital Frequency Synthesizer"**
Describes phase detector, emitter coupled oscillator, prescaler, programmable counter and gives phase locked loop analysis, for a 118 MHz to 136 MHz synthesizer.
Motorola AN-532A (10 pg.)

Phase Locked Loops (cont)

11 **"Phase-Locked Loop Design Fundamentals"**
(MC4016, MC4024, MC4044, MC4316, MC4324, MC4344)
Outlines fundamental design concepts for phase locked loops implemented with ICs. Gives equations using Laplace Transforms needed to evaluate the basic loop performance and briefly describes a design using MC4000 series devices.
Motorola AN-535 (11 pg.)

12 **"A New Generation of Integrated Avionic Synthesizers"**
Discusses several different types of servo phase locked loop systems and describes a synthesizer for avionic equipment.
Motorola AN-553 (9 pg.)

13 **"An ADF Frequency Synthesizer Utilizing Phase-Lock-Loop ICs"**
(MC1648, MC3062, MC4016, MC4018, MC4044, MC7400)
Describes circuit for a synthesizer suitable for the local oscillator function in aircraft Automatic Direction Finder equipment. Covers programming, trouble shooting, power supply requirements, performance, circuit modifications, and circuit construction.
Motorola AN-564 (9 pg.)

14 **"Crystal Switching Methods for MC12060/MC12061 Oscillators"**
(MC12060, MC12061)
Discusses methods of using diodes as rf switches to select crystals for these oscillators. The techniques are useful for electronic selection of one of a group of crystals with minimum disturbance to the series resonant frequency of the selected crystal.
Motorola AN-756 (5 pg.)

15 **"A Medium Cost PLL Varactor Tuning System Utilizing Off-the-Shelf Logic"**
See listing under (Linear) Consumer, TV (Motorola)

16 **"A Phase-Locked Loop Tuning System for Television"**
See listing under (Linear) Consumer, TV (Motorola)

17 **"The Phase-Locked Loop IC as a Communication System Building Block"**
(LM565, LM1496, LM1596)
Discusses basic phase locked loop operation, design considerations, noise performance and describes the LM565 circuit. Applications: IRIG channel demodulator, FSK demodulator, and weather satellite picture demodulator.
National Linear Applications Handbook, Vol. I, AN-46 (12 pg.)

18 **"SL650 Phase-Locked Loop Applications"**
(SL650, SL651)
Describes the circuit and application of this device that can operate to 0.5 MHz. Applications: Modulators-AM, FM, FSK, PAM, SCAM, tone burst, phase shift, delta, PWM, Waveform Generators-sine, triangle, mark/space ratio, staircase: Demodulators; Modem Systems, and a Digital Voltmeter.
Plessey Semiconductor SL650 Applications (32 pg.)

19 **"The RCA COS/MOS Phase-Locked-Loop: A Versatile Building Block for Micro-Power Digital and Analog Applications"**
(CD4046A)
Discusses PLL basics, characteristics of device, and circuit elements. Describes application in FM demodulation, a frequency synthesizer, split-phase synchronization and decoding, and PLL lock detection.
RCA ICAN-6101 (4 pg.)

LINEAR

Phase Locked Loops (cont)

1 **"Applications of the COS/MOS CD4059A Programmable Divide-by-N Counter: Digital Frequency Synthesis for FM Tuners and CB Transceivers"**
(CD4059)
Discusses frequency synthesis using the counter for an FM digital tuner and a CB transceiver.
RCA ICAN-6374 (12 pg.)

2 **"Low-Power Digital Frequency Synthesizers Utilizing COS/MOS ICs"**
(CD4000 Series)
Reviews digital phase-locked loops. Describes their implementation with CMOS for use in FM receiver synthesizers, both heterodyne and prescaling types.
RCA ICAN-6716 (15 pg.)

Photosensitive Devices

3 **"Light Sense"**
Covers optoelectronic sensors and systems including light activated switches and selfscanned photodiode arrays.
Integrated Photomatrix $6.00 (147 pg.)

4 **"Applications of Reticon Photodiode Arrays in Electron and X-Ray Detectors"**
(RL Series)
Describes the use of self-scanning photodiode arrays for detecting soft X-rays (1 to 10A) and electrons in the 10 to 100 KEV range.
Reticon Application Note 101 (4 pg.)

Power Control

5 **"A Monolithic Zero-Crossing AC Trigger (Trigac) for Thyristor Power Controls"**
(μA724)
Describes the μA742 zero-crossing ac trigger, which minimizes radio frequency interference generation. Discusses the circuit and operation of this device. Covers application with an SCR in a half wave circuit, full wave circuits, isolated system connections, and multi-phase power systems.
Fairchild Application Note 208 (5 pg.)

6 **"Servo Motor Drive Amplifiers"**
Discusses design of transformerless, AC servo amps using power Darlington transistors and IC op amps. Describes two power amplifiers, one using a 28 V power supply, the other, high voltage transistors. Also covers four op amp preamps and 90° phase shifters.
Motorola AN-590 (7 pg.)

7 **"Phase Control of AC Power with the SL440"**
(SL440)
Describes the operations of the SL440 power control circuit, and supply requirements. Applications include use with inductive loads, three phase systems, lighting, heating, motor and power supply control.
Plessey Semiconductor (38 pg.)

8 **"Some Applications of a Programmable Power Switch/Amplifier"**
(CA3094)
Brief circuit description of CA3094. Device delivers three watts average power, 10 watts peak power to external load. Applications include Class A power amplifiers and driver amplifiers for complementary transistors, wideband power multivibrators, oscillators, comparators, voltage regulators, analog timers, and motor-speed controllers.
RCA ICAN-6048 (12 pg.)

Power Control (cont)

9 **"Triac Power Controls for Three-Phase Systems"**
(CA3059)
Describes basic approach to designing triac control circuits for use in the switching of three-phase power. Outlines basic design rules and describes CA3059 zero-voltage switch. Discusses methods of isolation of dc logic circuitry. Covers recommended configurations for power control circuits.
RCA AN-6054 (6 pg.)

10 **"Features and Applications of RCA IC Zero-Voltage Switches"**
See listing under (Linear) Switches. (RCA)

11 **"ICs for Phase and Burst Control of SCR or Triac"**
(L120, L121)
Examines 2 ICs which are suitable for SCR and Triac firing. Description includes diagrams, equations, and applications in ON-OFF control and proportional control.
SGS-ATES Technical Note 116 (12 pg.)

12 **"A Monolithic Amplifier-Detector SCR Firing Circuit"**
(ULN-2300)
Describes the operation of the ULN-2300 linear differential amplifier with integral SCR. Covers response, impedance characteristics and closed loop charactertistics, open loop gain vs. temperature, and describes use as a sensitive control, as a drive amplifier in a typical control system and as a control for counters, relays, motors.
Sprague Electric TP69-4 (12 pg.)

13 **"Applications of High-Voltage/High-Current Monolithic Interface Circuits"**
(060, 400 Series, 500 Series)
Application of Series 060 Dual Darlington Switch and Series 400/500 Power Drivers in aircraft lamp drive circuit, solenoid printer, and 4-phase bipolar stepping motor.
Sprague Electric TP 72-4 (5 pg.)

Power Supplies

14 **"Power Supply Design Using the ICL8211 and ICL8212"**
(ICL8211, ICL8212)
Describes use of these devices as positive and negative voltage regulators, constant current sources, high voltage and overvoltage protection circuits, supply window detectors and power failure-shutdown systems.
Intersil A027 (8 pg.)

15 **"Fast IC Power Transistor with Thermal Protection"**
(LM195)
Circuit design of the LM195 IC power transistor, a three terminal device with safe area protection plus current and thermal limiting. Applications: 6 amp variable output switching regulator, 1 amp positive and negative voltage regulators, time delay circuit, and optically controlled switch, power amplifier and voltage follower.
National AN-110 (6 pg.)

16 **"General Purpose Power Supply"**
(LM395)
Diagrams a 25V, 10A supply using parallel LM395s for pass elements.
National Linear Applications Handbook, Vol. II, LB-28 (2 pg.)

©IC MASTER 1979

LINEAR

Preamplifiers

1 **"Audio Preamplifiers"**
(MONOCHIP)
Provides schematics and parameters for using the device in three separate preamplifier configurations.
Interdesign APN-11 (6 pg.)

2 **"Applications of the μA739 and μA749 Dual Preamplifier Integrated Circuits in Home Entertainment Equipment"**
See listing under (Linear) Consumer, Audio. (Fairchild)

3 **"Audio Handbook"**
See listing under (Linear) Consumer, Audio (National)

4 **"LM381 Low Noise Dual Preamplifier"**
(LM381)
Describes the circuit. Discusses application as various tape amplifiers, phono preamplifier, and an audio mixer.
National AN-64 (12 pg.)

5 **"LM381A Dual Preamplifier for Ultra-Low Noise Applications"**
(LM381A)
Gives detailed description of circuit operations of LM381A.
National AN-70 (4 pg.)

6 **"IC Preamp Challenges Choppers on Drift"**
(LM108A, LM121)
Describes circuit of the LM121 preamplifier and discusses offset balancing, achieving of low drift, and typical operating performance. Also covers effects of the associated operational amplifier citing the LM108A as an example.
National AN-79 (8 pg.)

7 **"Versatile IC Preamp Makes Thermocouple Amplifier with Cold Junction Compensation"**
(LM321, LM308A)
Discusses use of LM321 preamp with LM308A operational amplifier to form a precision, low-drift operational amplifier that also acts as a cold junction compensator.
National Linear Application Handbook, Vol. II, LB-24 (2 pg.)

Regulators

8 **"The Voltage Regulator Applications Handbook"**
(μA104, μA105, μA109, μA723, μA7600, μA7800, μA78L00, μA78M00, μA79E00)
Gives specifications and parameters for various IC regulators and includes a selection guide. It devotes two chapters to each major regulatory family, the first chapter describes design and electrical characteristics, the second discusses electrical and thermal considerations which are useful as application guidelines.
Includes appendices covering switching regulator and power supply design and a guide to the selection and operation of suitable power transistors. Applications of 7800 and 78M00 include fixed output, current and dual polarity regulators.
The 79E00 applications include use as a high current negative voltage regulator. The 723 is discussed in 150 mA maximum, positive shunt regulators with high line rejection or high input voltage, floating positive regulators, medium/high output current negative regulators, and several other applications.
The 104, 105, and 109 applications include high current, switching and floating regulators.
Fairchild Voltage Regulator Applications Handbook (96 pg.)

Regulators (cont)

9 **"Resolving the Problems of Switching Mode Power Supplies with the ZN1066"**
(ZN1066)
Describes switching mode power supplies and problems involved in using, including current limit and switching transistor protection, low voltage cutoff, and impulse starting.
Ferranti (20 pg.)

10 **"Hybrid Voltage Regulators"**
(42050 Series, 42051 Series)
Describes device and discusses current foldback and thermal considerations. Also notes application precautions.
Micropac (9 pg.)

11 **"Designing Digitally-Controlled Power Supplies"**
(MC1406, MC1408, MC1466, MC1723)
Discusses two approaches to designing power supplies, one using the MC1723 voltage regulator, the other using the MC1466 floating regulator with optoelectronic isolation. Also discusses BCD-to-binary converter and memory options.
Motorola AN-703 (8 pg.)

12 **"A New Approach to Switching Regulators"**
Describes a 24 volt 3 ampere switching mode supply which operates at 20 kHz from a 120 volt AC line with 70% efficiency. Briefly discusses load-line shaping to reduce power losses and to reduce noise.
Motorola AN-719 (11 pg.)

13 **"Voltage Regulator Handbook"**
(MC78L00, MC78M00, MC7700, MC7800, MLM109, MLM209, MLM309, MC79L00, MC7900, MLM105, MLM205, MLM305, MLM104, MLM204, MLM304, MC1723, MC1469, MC1569, MC1463, MC1563, MC1468, MC1568, MC1466, MC1566, MC3420, MC3423, LM117, LM317, LM123, LM323)
Discusses basic voltage regulator theory and design including such relevant topics as series pass elements, heatsinking, layout, input power supply design, reliability, and troubleshooting. Also contains product data sheets.
Motorola $2.50 (202 pg.)

14 **"A Versatile, Monolithic Voltage Regulator"**
(LM100)
Circuit operation. Applications for the LM100 between 2 v to 30 v (up to 2 amps with two external transistors) are discussed. Includes high power, switchback current limiting, negative voltage, temperature compensating, and switching regulators.
National Linear Applications Handbook, Vol. I, AN-1 (11 pg.)

15 **"Designing Switching Regulators"**
(LM100)
LM100 applications discussed include high current, driven switching, current limiting, negative and high voltage regulators, as well as switching, and linear regulator combinations.
National Linear Applications Handbook, Vol. I, AN-2 (12 pg.)

16 **"Tracking Voltage Regulators"**
(LM104, LM105, LM204, LM205, LM304, LM305)
Describes adjusting several regulator voltages with one potentiometer, tracking positive and negative regulators using the LM104 as an amplifier, and tracking regulators with different output voltages.
National Linear Applications Handbook, Vol. I, LB-7 (2 pg.)

Regulators (cont)

1 **"New Uses for the LM100 Regulator"**
(LM100)
Applications include shunt regulator, switching regulator with overload shutoff, temperature controller, power amplifier, SSB transmitter, light-intensity regulator, and photomultiplier tube supply.
National Linear Applications Handbook, Vol. I, AN-8 (12 pg.)

2 **"IC Regulators Simplify Power Supply Design"**
(LM104, LM105, LM204, LM205, LM304, LM305)
Describes use of LM104 and LM105, in 0.2 and 2A regulator circuits. Provides circuit construction hints.
National Linear Applications Handbook, Vol. I, LB-10 (2 pg.)

3 **"High Stability Regulators"**
(LM108A, LM109, LM208A, LM209, LM308A, LM309)
Describes design and gives schematics for high stability positive and negative regulators using LM109 and LM108A.
National Linear Applications Handbook, Vol. I, LB-15 (2 pg.)

4 **"Designs for Negative Voltage Regulators"**
(LM104, LM204, LM304)
Describes the LM104 and covers pitfalls that cause unexpected failures as well as protection schemes. Includes discussions of high current regulators, symmetrical power supplies, high voltage regulators, switching and high current switching regulators, and driven switching regulators.
National Linear Applications Handbook, Vol. I, AN-21 (16 pg.)

5 **"IC Provides On-Card Regulation for Logic Circuits"**
(LM109, LM209, LM309)
Discusses design of regulators in general and describes the LM109. Covers application as a fixed 5V regulator, adjustable-output regulator, current regulator and high stability regulator.
National AN-42 (6 pg.)

6 **"LM125/LM126/LM127 Precision Dual Tracking Regulators"**
(LM125, LM126, LM127)
Circuit description, operation and applications, including current boosting, are discussed along with charts depicting external current limiting characteristics and a discussion of foldback current limiting. Electronic turn-off of the output without removing the input voltage is also described.
National AN-82 (15 pg.)

7 **"LM340 Series — Three Terminal Positive Regulators"**
(LM340)
Describes this 1 ampere regulator circuit. Applications: constant current source, high current regulator with short circuit current limit, 5 v regulator for TTL, adjustable output voltage regulators, tracking dual regulator, and high voltage regulators.
National AN-103 (12 pg.)

8 **"Constant Current LED"**
(NSL4944)
Describes how this two lead LED/IC device can be used not only as an indicator but also as a rectifier and constant current source.
National AN-153 (4 pg.)

9 **"Applications for an Adjustable IC Power Regulator"**
(LM117, LM217, LM317)
Covers basic LM117 circuit operation. Shows basic applications plus use for multiple outputs, current regulation, constant voltage/constant current, and a voltage to 2-wire (10-50 ma) current transmitter.
National AN-178 (4 pg.)

Regulators (cont)

10 **"Three-Terminal Regulator is Adjustable"**
(LM117, LM217, LM317)
Covers basic LM117 circuit operation, overload protection circuits and operating considerations. Includes applications with logic shutdown, multiple regulators with single control, switching regulators and battery chargers.
National AN-181 (3 pg.)

11 **"Improving Power Supply Reliability with IC Power Regulators"**
(LM117, LM217, LM317)
Describes various regulator circuit design practices to improve system reliability.
National AN-182 (3 pg.)

12 **"Worst Case Power Dissipation in Linear Regulators"**
(LM100, LM104, LM200, LM204, LM300, LM304)
Discusses problems of excessive dissipation in regulators and suggests solutions using LM100 and LM104.
National Linear Applications Handbook, Vol. I, LB-3 (2 pg.)

13 **"Adjustable Three-Terminal Regulator for Low Cost Battery Charging Systems"**
(LM317)
Discusses the ability to adjust the output of the LM317 voltage regulator as it relates to battery charging systems.
National LB-35 (2 pg.)

14 **"A Novel FET Micropower Voltage Regulator"**
Depicts the building of a micropower voltage regulator using FETs.
National FET Databook (2 pg.)

15 **"Voltage Regulator Handbook"**
(LM109, LM120, LM123, LM125, LM126, LM127, LM145, LM340, LM341, LM342, LM7800, LM78L00)
Covers product selection; heat flow and thermal resistance; commercial and custom heat sinks; applications of positive, negative and dual regulators; power supply design and includes data sheets for the product families listed above.
National Voltage Regulator Handbook, $3.00 (139 pg.)

16 **"The 4195 Regulator"**
(RC4195, RM4195)
Describes application as a ±15 v, 100 ma regulator; a ±2.5 a regulator; a ±15 to ±50 v unit, or a complementary ±3 to ±27 v device.
Raytheon Semiconductor Application Note (9 pg.)

17 **"Applications of the CA3085 Series Monolithic IC Voltage Regulators"**
(CA3085)
Circuit description of positive regulators with output currents up to 100 milliamperes from −55°C to +125°C. Applications include high-current and constant-current regulators; switching, dual-tracking and high-voltage regulators. Use as a general purpose amplifier, and various methods of current limiting are mentioned.
RCA ICAN-6157 (11 pg.)

18 **"A Switching Regulator Using an RCA P-N-P Power Darlington Transistor"**
(CA3085)
Gives a detailed discussion of a 28 v input, 4-16 v, 11 a, switching regulator.
RCA AN-6195 (8 pg.)

©IC MASTER 1979

LINEAR

Regulators (cont)

1 **"Using a Dual-Polarity, Tracking Voltage Regulator"**
(SG1501, SG2501, SG3501)
Describes the circuit and use of the SG1501 series of dual regulators.
Silicon General Applications Bulletin 1 (6 pg.)

2 **"Current-limited and Voltage-regulated Battery Charger"**
(TL430)
Outlines construction of a battery charger that will rejuvenate a totally discharged 44 ampere-hour lead-acid battery in 3 hours.
Texas Instruments CA-194 (9 pg.)

3 **"Designing Switching Voltage Regulators with the TL497"**
(TL497)
Covers principles of operation and use as a step-down, step-up or inverting regulator.
Texas Instruments Application Report CA-189 (16 pg.)

Switches

4 **"Touch Control Circuits for Capacitance Switching"**
(S9260 Series)
Discusses using the devices to replace mechanical switching systems. Covers noise immunity, determining touch switch sizes, multiplexed operation, and touch control panel material among other topics.
American Microsystems (16 pg.)

5 **"Applications of the μA742 TRIGAC — A Zero Crossing AC Trigger"**
(μA742)
Describes this TRIGAC circuit. Includes a discussion of the transfer characteristics and performance plus operation from ac and dc supplies. Applications: 110 V ac single threshold control; single phase, 110 V ac dual threshold control with hysteresis; 110 V ac dual threshold control with time proportioning; with time proportioning for Y or Δ loads; operating with transformer isolation between control circuit and ac line; output pulse amplifier with transformer; output pulse inverter; period extender for time proportioning; initial cycle delay; sensor failure detection circuit; time delay "relay" circuit; 208 V ac dual threshold control 110 V ac, 400 Hz dual threshold control with single TRIGAC for Y loads.
Also includes a section listing parts and component location diagrams for these applications and discusses operation with a fixed dc supply. Covers use of the TRIGAC with nonresistive loads, discusses thyristor cells, and full wave output power switches for use with the device.
Fairchild (30 pg.)

6 **"Applications of Ultra-High Speed N-Channel MOSFET Switches"**
(MEM780)
Presents design guidelines, considerations, and practical circuits for analog multiplex switching.
General Instrument Bulletin 1602 (6 pg.)

7 **"Understanding and Applying the Analog Switch"**
(IH5001, IH5009, IH5025, IH5040)
Compares parameters of analog switches. Applications of several switch families are discussed, including 3-channel differential multiplexer, gain programmable amplifier, gain ranging circuit, sample and hold circuit.
Intersil Application Bulletin A003 (16 pg.)

Switches (cont)

8 **"The IH5009 Series of Low Cost Analog Switches"**
(IH5009 Series)
Describes circuit parameters, logic compatibility, and virtual ground switching applications including 4-channel multiplexer, gain ranging circuit, gain programmable amplifier and 16-channel multiplexer.
Intersil Application Bulletin A0004 (8 pg.)

9 **"A New CMOS Analog Gate Technology"**
General discussion of "latch up." Describes "floating body" process, which eliminates this problem.
Intersil Application Note A006 (2 pg.)

10 **"Application of the MC3416 Crosspoint Switch"**
(MC3416)
Describes operation and use of this 4 × 4 balanced crosspoint switch in telephone applications including PABX. Appendices cover dielectric isolation, SCR action and testing.
Motorola AN-760 (15 pg.)

11 **"High Speed MOS Commutators"**
(MM451, MM453, MM454)
Discusses the lowered threshold voltages in commutators, on and off resistances, switching speed, noise and high-frequency noise control.
National Linear Applications Handbook, Vol. I, AN-28 (8 pg.)

12 **"Analog-Signal Commutation"**
(MM450, MM451, MM454, MM550, MM551, MM552)
Describes dc characteristics involved in MOS IC switching of analog signals when the signal input range varies between ± 10 v.
National Linear Applications Handbook, Vol. I, AN-33 (6 pg.)

13 **"Applications of MOS Analog Switches"**
(LH0014, LH0019)
Discusses basic commutation circuits and describes the use of the LH0014 and LH0019 in linear amplifier applications, including reset functions and chopper circuits. Covers use of MOS switches as suppressed carrier double-sideband modulators and double-sideband demodulators. Also describes a circuit for a phase-locked loop AM-FM detector without tuned circuits.
National Linear Applications Handbook, Vol. I, AN-38 (8 pg.)

14 **"PIN Diode Drivers"**
(DH0035, DH0035C)
Describes PIN diode switching requirements and application of DH0035 as a driver. Includes discussion of anode ground and cathode ground designs and of repetition rate considerations.
National AN-49 (6 pg.)

15 **"High Speed Analog Switches"**
(AM1000, AM1001, AM1002)
Discusses time domain multiplexing, current mode multiplexing, the switching characteristics of the AM1000 JFET switches, and drive circuits.
National AN-53 (6 pg.)

16 **"Features and Applications of RCA IC Zero-Voltage Switches"**
(CA3058, CA3059, CA3079)
Discusses zero-voltage switch operation in general. Operation primarily with thyristors in ac power control and switching applications, including electric heating, oven/broiler control, machine control, light control and industrial systems.
RCA ICAN-6182 (6 pg.)

Switches (cont)

1 **"Applications of the RCA CA3062 IC Photo-Detector and Power Amplifier in Switching Circuits"**
(CA3062)
Describes circuit operation and application in a latched memory circuit, a light activated triac control, a triac control with automatic shut off and alarm, and a triac intrusion alarm system.
RCA ICAN-6538 (6 pg.)

2 **"Some Applications of a Programmable Power Switch/Amplifier"**
See listing under (Linear) Power Control. (RCA)

3 **"FETs as Analog Switches"**
General discussion of FET operation: detailed discussion of factors affecting switch performance, including specific load problems and applicable driver circuits.
Siliconix AN72-2 (12 pg.)

4 **"IC Multiplexer Increases Analog Switching Speeds"**
(DG506, DG181)
Describes single and two level IC multiplexing systems, including the advantages and disadvantages of each.
Siliconix AN73-2 (5 pg.)

5 **"Switching High-Frequency Signals with FET Integrated Circuits"**
(DG133, DG171, DG181, DG200)
Discussion of DG133/171/181/200 as rf switches. Gives equivalent circuits. "Off" isolation and "On" performance data. Applications: control of video monitor and switching between two video cameras.
Siliconix AN73-3 (16 pg.)

6 **"Driver Circuits for the JFET Analog Switch"**
Discussion and comparison of resistor-coupled diode charge transfer, space transistor charge transfer, and switched resistor driver circuits for JFET switches.
Siliconix AN73-5 (12 pg.)

7 **"Analog Switches in Sample and Hold Circuits"**
Covers the effects of FET analog switch current handling capability on settling time and the effects of offset characteristics on sample and hold system accuracy. Describes inverting and non-inverting sample and hold circuits.
Siliconix AN74-2 (4 pg.)

8 **"CMOS Analog Switches — A Powerful Design Tool"**
Describes CMOS switch construction, characteristics and operating precautions. Applications include: a four channel switch to multiplex a scope input, a low pass filter with digitally controlled frequency response, an amplifier with programmable inputs and gain, a sample and hold circuit, a latching switch, high frequency switching and multiplexer systems.
Siliconix AN75-1 (16 pg.)

9 **"Designing with Monolithic FET Switches"**
Describes MOSFET and JFET switch operation plus driver considerations.
Siliconix TA73-2 (4 pg.)

10 **"Analog Switches and Their Applications"**
(DG300 Series, DG506)
Introduces basic semiconductor theory and discusses in detail FET analog switches. Various circuit combinations including driver circuits, multiplexing, sample-and-hold circuits, N-path filters, and converters are also analyzed.
Siliconix $4.00 (324 pg.)

Switches (cont)

11 **"High Speed CMOS Analog Switches"**
(DG300 Series, DG181 Series)
Discusses the devices in low power, multiplexing, and thermocouple applications. (Includes AN76-6)
Siliconix (24 pg.)

12 **"Specifying and Testing Multiplexers"**
Describes how Teledyne Philbrick defines and measures analog multiplexer parameters with emphasis on CMOS types.
Teledyne Philbrick Applications Bulletin AN-31 (4 pg.)

Thermal Considerations

For Temperature Sensors see (Linear) Transducers

13 **"Thermal Evaluation of Integrated Circuits"**
Describes four methods for thermal evaluation, including reverse biasing substrate diodes.
Fairchild Application Note 205 (8 pg.)

14 **"Mounting Procedure for, and Thermal Aspects of, Thermopad Plastic Power Devices"**
Covers various methods of mounting and heat-sinking Motorola case number 77, 90, and 199 plastic power devices. Also discusses thermal resistance considerations, lead forming, and circuit board cleaning.
Motorola AN-290B (9 pg.)

15 **"Transient Thermal Resistance — General Data and Its Use"**
Discusses transient thermal resistance and its use and describes methods using various degrees of approximations to determine the junction temperature rise of a device. Also covers the concept of a duty cycle family of curves to simplify calculation of junction temperature rise under a repetitive pulse train.
Motorola AN-569 (15 pg.)

16 **"Mounting Techniques for Metal Packaged Power Semiconductors"**
Discusses preparation of mounting surfaces, using thermal compounds, and fastening techniques. Gives typical interface thermal resistance for a number of packages.
Motorola AN-599 (5 pg.)

17 **"Low Cost LED Thermometer"**
See listing under (Linear) Transducers. (National)

18 **"Micropower Thermometer"**
See listing under (Linear) Transducers. (National)

19 **"Thermal Resistance of Integrated Circuit Packages"**
Describes method of measuring package thermal resistance while package is immersed in a constant-temperature, circulating oil bath that acts as an infinite heat sink.
Sprague Electric TP 72-7 (5 pg.)

20 **"Thermal Design for Plastic Integrated Circuits"**
(ULN-2277)
Discussion of chip power dissipation—using amplifier as an example, heat dissipation, ULN-2277 dual 2-watt audio power heat sinks, heat sink finishes, and forced air cooling.
Sprague Electric TP 74-1 (7 pg.)

©IC MASTER 1979

LINEAR

Thermal Considerations (cont)

1 **"New Heat Sinking Techniques for Hermetic DIPs"**
Describes use of stamped and extruded heat sinks and method of reversing IC die and bonding chip directly to Kovar base.
Sprague Electric TP 74-4 (4 pg.)

Timers

2 **"Single-Chip Frequency Synthesizer Employing the XR2240"**
(XR2240)
Describes use of this timer/counter as a single-chip frequency synthesizer: $f_o = f, (m/n + 1)$ Where $f_o < 200$ kHz. Describes generating 100 Hz synchronized to 60 Hz line.
Exar AN-07 (3 pg.)

3 **"Precision Timer"**
(ZN1034E)
Explains the device and its use in various applications including a wiper control, a metronome, and a battery charger.
Ferranti Electric (19 pg.)

4 **"Digital Timer for Your Darkroom"**
(C685)
Describes a digital timer that counts down in either minutes and seconds or seconds only for darkroom use.
General Instrument Bulletin 0204 (12 pg.)

5 **"12-Hour Digital Electronic Automotive Clock"**
(CK3500)
Covers the use of the CK3500 I^2Lclock chip in a typical automobile application. Briefly introduces I^2L technology and provides circuit diagram.
General Instrument Bulletin 0302 (6 pg.)

6 **"AM/FM Frequency Display"**
(AY3-8112)
Describes a frequency and time display that can be an add-on accessory or built into a modified AM/FM set. Provides schematics and parts lists.
General Instrument Bulletin 0418 (8 pg.)

7 **"Wire Range Timer"**
(LM122, LM301A)
Describes a timer that, through the use of a single logarithmic control, can be adjusted from 2 ms to 2000 seconds.
National Semiconductor LB-38 (2 pg.)

8 **"Versatile Timer Operates from Microseconds to Hours"**
(LM122)
Describes the LM122 circuit and its operation. Includes discussion of pin functions, timing errors and noisy environments. Discusses use as various timers, as a pulse width detector, a comparator, an oscillator, a two-terminal time delay switch, and a frequency to voltage converter.
National AN-97 (12 pg.)

9 **"Using National Clock Integrated Circuits in Timer Applications"**
(MM5309, MM5311, MM5312, MM5315)
Describes demultiplexing techniques to generate time intervals and low frequency square waves. Gives as an example a fail-safe lighting timer.
National AN-143 (4 pg.)

Timers (cont)

10 **"1.3 Volt IC Flasher, Oscillator Trigger, or Alarm"**
(LM3903)
Describes circuit operation. Covers various flasher, tone generator and trigger circuits, especially for low voltage applications in anything from toys to laboratory equipment.
National AN-154 (10 pg.)

11 **"MM5865 Universal Timer Applications"**
(MM5865)
Provides block diagram and system description, discusses general timing and programming capabilities, suggests timing and counting applications.
National AN-168 (10 pg.)

12 **"A 4-Digit, 7-Function Stop Watch/Timer"**
(MM5865)
Gives detailed instructions for the circuit and construction of a 4-digit, 7-function timer with a display resolution of 0.01, 0.1, and 1 second, using the MM5865.
National AN-169 (14 pg.)

13 **"Problem Solving with the Dual Set Point Timer"**
(DF215)
Describes the device and its use as various timers and controls.
Siliconix AN76-2 (10 pg.)

Transducers

14 **"The LX1602A Pressure Transducer and Altimeter Applications"**
(LX1602A)
Describes how to use this transducer along with additional electronics to build an altimeter that operates over a range of −1,000 feet to +50,000 feet.
National AN-91 (3 pg.)

15 **"Installation Ideas for Pressure Transducers"**
(LX1600, LX1700, LX1400, LX1701)
Provides suggestions for mounting National transducers for various applications. Includes diagrams and typical mounting configurations.
National AN-92 (4 pg.)

16 **"Transducers in Fluid Flow Applications"**
(LX1602A)
Discusses application of LX1602A in pressure vessel, open flow and closed flow applications.
National AN-93 (8 pg.)

17 **"LX Series Pressure Transducers: Design and Applications Information"**
(LX1600A, LX1601A, LX1602A)
Describes hybrid transducer circuit and applications, including pressure to frequency converter, latching altitude detector, digital readout barometer and altimeter.
National AN-94 (8 pg.)

18 **"Pressure Transducer Load Cell"**
(LX1700G)
Describes use of LX1700G pressure transducer to measure weight.
National AN-95 (4 pg.)

LINEAR

Transducers (cont)

1 **"Pressure Transducers as Accelerometers"**
(LX1700G)
Discusses uses of accelerometers and describes scheme of converting LX series pressure transducers to cover ranges from fractions to thousands of g's.
National AN-96 (4 pg.)

2 **"A New Interfacing Concept: The Monolithic Temperature Transducer"**
(LX5600, LX5700)
Covers alternate methods of powering the LX5600, load isolation and an unusual active thermal shield (the shield tracks the surface temperature of the sensor.) Describes use as a thermal transducer, temperature to frequency converter, and a temperature controller with rate-of-change sensing. Discusses use of differential temperature measurements for liquid or moving air detection (including) wind) and for position sensing (using a heat source as a position reference.
National AN-132 (10 pg.)

3 **"Micropower Thermometer"**
(LX5600)
Describes use of the LK5600 as a thermometer whose output is a current proportional to temperature and can drive a meter for direct readout.
National Linear Applications Handbook, Vol. II, LB-27 (2 pg.)

4 **"Low Cost LED Thermometer"**
(LX5700)
Presents circuit for a −40° to 100°C thermometer with a conversion circuit for −40° to 199°F.
National Linear Applications Handbook, Vol. II, LB-30 (2 pg.)

5 **"Crystal Oven Controller and Precision Voltage Reference"**
(LM199, LM299, LM399, LM199A, LM299A, LM399A)
Shows the use of the LM199 both as an oven temperature controller and a voltage reference at the same time.
National Linear Applications Handbook, Vol. II, LB-31 (2 pg.)

6 **"Simple Temperature Control"**
(LX5600)
Discusses setting up a temperature control system using the LX5600.
National LB-36 (2 pg.)

7 **"The Multi-Level Switch Kit, Part No. SK1007"**
Details the use of any LX series pressure transducer to produce a high level analog output as well as three independent switch points.
National TB-1 (2 pgs.)

8 **"Transducer Sensor Diaphram 15 Million Cycle Life Test"**
Findings in the continuing test of National's transducer sensing elements — a silicon membrane approx. 1 mil. thick.
National TB-3 (1 pg.)

9 **"Use of the SK1007 Pressure Transducer Kit in Vault Alarm Systems"**
Describes application of this multi-level switch kit with a pressure transducer in vault alarm systems.
National TB-7 (2 pg.)

10 **"Transducer Fluid Filled Option"**
Describes the "Fluid-Filled" methods of protecting transducers from hostile environments. Rates the resistance of silicone rubber to some common fluids.
National TB-8 (2 pg.)

Transducers (cont)

11 **"Application Circuits of Temperature Sensor and Temperature Controller IC's"**
(μPC616, μPC3911)
Provides device characteristics and four basic applications with diagrams.
NEC America (6 pg.)

12 **"REF-02 Temperature Controller"**
(CMP-02, REF-02)
Describes temperature control using the REF-02 and the CMP-02 comparator.
Precision Monolithics AB-4 (1 pg.)

13 **"Thermometer Application of the REF-02"**
(REF-02)
Discusses thermometer essentials, bandgap voltage reference theory, and basic circuit design using device.
Precision Monolithics AN-18 (4 pg.)

Voltage References

14 **"1.2 Volt Reference"**
(LM113, LM313)
Describes the LM113 temperature compensated shunt regulator diode. Applications: low voltage regulator circuits, bias current source for a differential amplifier, and an electronic thermometer circuit.
National Linear Applications Handbook, Vol. I, N-56 (4 pg.)

15 **"IC Voltage Reference has 1 PPM per Degree Drift"**
(LM199, LM299, LM399, LM199A, LM299A, LM399A)
Describes this device with a sub surface Zener and an on-chip temperature stabilizer. Several applications are also covered.
National Linear Applications Handbook, Vol. II, AN-161 (6 pg.)

16 **"IC Zener Eases Reference Design"**
(LM129, LM329)
Describes LM129 circuit and operation. Covers use in voltage reference and regulator applications.
National AN-173 (3 pg.)

17 **"References for A/D Converters"**
(LM199, LM399, LM199A, LM399A)
Discusses requirements of references for various accuracies of A/D converters. Gives reference circuit designs.
National AN-184 (4 pg.)

18 **"A Micropower Voltage Reference"**
Describes a voltage reference made by operating a JFET slightly below pinch-off along with an op amp to convert current to voltage.
National Linear Applications Handbook, Vol. II, LB-34 (2 pg.)

19 **"Crystal Oven Controller and Precision Voltage Reference"**
See listing under (Linear) Transducers (National)

©IC MASTER 1979

MEMORY

Analog

1 **"Delaying AF Signals with MOS Delay-Lines TCA350"**
(TCA350)
Discusses bucket brigade circuits and practical applications employing this device.
ITT Semiconductors (7 pg.)

2 **"MOS Delay Lines"**
(DM8000, DM8510, DM8830, MM506)
Covers use of MOS shift registers to build delay lines.
National MB-4 (2 pg.)

3 **"Acoustic Applications of Serial Analog Delay Devices"**
(SAD1024)
Covers use in reverberation, vibrato, chorus, wow and flutter control plus considerations in using this device.
Reticon Application Note 104 (8 pg.)

4 **"Bucket Brigade Devices Circa 1976"**
Gives history of development, construction features, and advantages of bucket brigade devices.
Reticon Technical No. 107 (11 pg.)

5 **"A Tapped Analog Delay for Sampled Data Signal Processing"**
Introduces tapped analog delays and gives various applications heretofore accomplished by digital techniques.
Reticon Application Note No. 105 (11 pg.)

6 **"Serial Operation of Clocked Analog Delay Lines to Obtain Long Delay"**
(SAD1024A)
Describes advantages, coupling, and performance of device.
Reticon Application Note No. 109 (8 pg.)

7 **"Implementation of Discrete-Time Analog Filter and Processing Systems"**
(TAD32A)
Discusses tapped analog delay device operation and areas of application, including transversal and recursive filters.
Reticon Application Note No. 111 (10 pg.)

8 **"Charge Transfer Devices for Sampled-Data Processing"**
Discusses the application of charge transfer devices to analog and digital signal processing. Compares CTD devices. Describes Tapped Analog Delay, the Binary Analog Correlator, the Analog Correlator and the Transversal Filter.
Reticon Application Notes No. 114 (11 pg.)

Character Generators

9 **"A CRT Display System Using NMOS Memories"**
(MC6545, MCM6570, MCM6571)
Discusses basic CRT operation, character formation and describes the 8K-bit MCM6570 character generators. Describes a 128-character system in detail, including counter and retrace control, memory select, and address register sections.
Motorola AN-706A (15 pg.)

10 **"American and European Fonts in Standard Character Generators"**
(MM4240, MM5240, MM4241, MM5241)
Depicts the standard 64 character subsets for these devices.
National AN-57 (6 pg.)

Character Generators (cont)

11 **"DM8678 Bipolar Character Generator"**
(DM8678)
Explains the operation of the device and the various features which include circuit address latches, the line counter, the 7-bit shift register, and the output buffer.
National AN-167 (4 pg.)

12 **"The Systems Approach to Character Generators"**
See listing under (Memory) ROMs. (National)

13 **"Digital Display Systems"**
Using TTL compatible MOS ROMs to generate displays. Gives circuit diagrams and a sample readout.
National MB-8 (2 pg.)

14 **"7 x 9 Display Character Generator"**
Uses three MOS ROMs and some TTL logic to create a font of 64 7 × 9 dot-type characters. A circut diagram and suggested character forms are provided.
National MB-13 (2 pg.)

15 **"1024 Step Programmable Calculator with Non-Volatile EAROM Memory"**
(ER3401)
Describes a programming circuit that can store up to 1024 program steps, each being a digit or function key entry, and interfaces to a calculator chip. Supplies diagrams and example program.
General Instrument Bulletin 0203 (4 pg.)

16 **"EAROM Technology"**
Describes Electrically Alterable Read Only Memories built with MNOS transistors. Discusses reliability and provides diagrams of application in a phase-locked loop tuner, a lock, and a telephone repertory dialer.
General Instrument Bulletin 1201 (8 pg.)

17 **"The Role of Non-Volatile Memories in Consumer Electronics"**
Briefly describes MNOS technology, updating EAROMs, and use of EAROMs to store data, to keep track of system status, and store programs for microcontrollers.
General Instrument Bulletin 1202 (3 pg.)

18 **"Electronic Digital Lock"**
(ER2050)
Schematic and description of an 8-digit electronic lock that has 4 different "open" codes and a programming mode that allows any of the codes to be changed.
General Instrument Bulletin 1206 (3 pg.)

19 **"Using the ER3401"**
(ER3401)
Presents basic device operation and supplies diagrams for a bench-top evaluator/programmer and a dc inverter.
General Instrument Bulletin 1203 (5 pg.)

20 **"An ER2051 Programmer"**
Presents a programmer that automatically erturns an EAROM to standby condition following read, erase, or write commands, and provides stable timing controls for all modes of operation.
General Instrument Bulletin 1204A (3 pg.)

21 **"A Voltage Switching Circuit for the ER2401/ER2800"**
(ER2401, ER2800)
Furnishes a diagram of a voltage switching circuit for the devices and the control signal truth table describing its operation.
General Instrument Bulletin 1205 (2 pg.)

Character Generators (cont)

1 **"Eight and Sixteen-Bit EAROM Module For Minis & Micros"**
(ER3400)
Describes the design of an 8K byte EAROM module with a 1.2 μsec access time. The memory module can be read and written like conventional memory, and it can be reconfigured to sixteen-bit words with the change of a single logic level. Also details an EAROM sequencer.
General Instruments Bulletin 1208

Interface

2 **"The Recovery of Recorded Digital Information in Drum, Disk and Tape Systems"**
Reviews methods for converting the analog signal obtained from a magnetic recording into digital format.
Motorola AN-711 (10 pg.)

3 **"Applying Modern Clock Drivers to MOS Memories"**
(DS0025, DS0026)
Covers use of 0025/26 drivers in MOS memory systems. Information includes selection of packages and heat sinks, power dissipation, rise and fall time, power supply decoupling, system clock line ringing and crosstalk, input coupling techniques, and sample calculations.
National AN-76 (12 pg.)

4 **"Interfacing Circuits for MOS Dynamic Random Access Memories"**
Discusses interfacing methods employing level shifters (TTL to MOS levels) with boosters, level shifters (MOS to TTL levels), and sense amplifiers.
Nortec Applications Note No. 25 Rev. A (3 pg.)

5 **"Charge Pump Driver for 7001 RAMs"**
(SN54508)
Defines a method for driving the charge storage pump input of a 7001 RAM. Provides a description of the basic storage pump RAM cell and the charge pump circuit diagram. Gives performance curves.
Texas Instruments Application Report CA-178 (6 pg.)

6 **"High Speed TTL Interfacing for 7001 Static RAMs"**
(SN75261, SN75365)
Illustrates interface techniques for driving the 7001 RAM chip-select input, and sensing the memory output.
Texas Instruments Application Report CA-179 (8 pg.)

Microprogramming

7 **"Tri-State Logic in High Speed Memories of Microprogrammed Computers"**
See listing under (Digital) TTL, General. (National)

8 **"How to Design with the 8X02 Control Store Sequencer"**
See listing under (Microprocessor) Systems (Signetics)

9 **"Signetics Micro Assembler Reference Manual"**
See listing under (Microprocessor) Programming (Signetics)

PROMs

10 **"Programming AMI S6834 and S5204A EPROMs"**
(S5204A, S6834)
Compares on-board versus dedicated-socket programming and suggestions on programming system design.
American Microsystems (3 pg.)

11 **"EA2708 EPROM Application Note"**
(EA2708)
Comments on read characteristics of the device and its use in microprocessor systems.
Electronic Arrays (8 pg.)

12 **"Programmable Read Only Memories"**
(93417, 93427, 93436, 93438, 93448, 93452, 93453)
Gives general background on PROMs, describes programming procedures, discusses power switching, address expansion, 8-bit binary to decimal decoding and programmed logic controller.
Fairchild Application Note 333 (16 pg.)

13 **"The MB8518 EPROM"**
(MB8518)
Characterizes device and discusses programming and erasing it. Provides a schematic for incorporating a switching power supply to save power.
Fujitsu AN201 (14 pg.)

14 **"Application of the Intel 2708 8K Erasable PROM"**
(2708)
Covers characteristics, operation, programming and erasure, reduced power and interface.
Intel Application Note AP-17 (15 pg.)

15 **"Power Switching"**
Describes a method for power switching Intersil's PROMs and FPLAs, and specifies the design tradeoffs and performance to be expected.
Intersil Application Bulletin MB003 (4 pg.)

16 **"Intel Memory Design Handbook"**
See listing under (Memory) RAMs (Intel)

17 **"Programming the MCM5003/5004 Programmable Read Only Memory"**
(MCM5003, MCM5004)
Discusses programming methods for this 64 × 8 bit memory, describes circuit and operation. Describes a simple programmer using five ICs and a more sophisticated version using 25 ICs offering automatic sequencing.
Motorola AN-550 (12 pg.)

18 **"PROM Power-Down Circuits"**
(DM74S287)
Describes several ways to power-down bipolar, three-state PROMs.
National AN-171 (4 pg.)

19 **"A PROM Programmer for the SC/MP LCDs"**
(SC/MP, MM4204, MM5204)
Provides a method for the user of the SC/MP LCDs to program MM4204 PROMs. Using wire-wrap techniques the user can construct a programmer that plugs into the SC/MP LCDs backplane and programs a 512 x 8 PROM in 10 seconds.
National AN-189 (23 pg.)

©IC MASTER 1979

MEMORY

RAMs

1 **"Application of First-In First-Out Memories"**
(AM2812, AM2813, AM2814, 3341)
Describes the function of a first-in, first-out memory, methods of constructing FIFO buffers and the operation of the above P-channel MOS devices. Discusses storage and control, expansion methods, interfacing, and applications in an N-bit shift register and as a key encoder on key matrix.
Advanced Micro Devices Application Note (9 pg.)

2 **"The AM9338 Multiple Port Memory"**
(9338)
Describes applications for this 8-word by 1-bit three-address memory, including the working store for high-speed, three address computers; first in, first out (asynchronous buffer) memory; and direct address/indirect address memory.
Advanced Micro Devices Application Note 4 (pg.)

3 **"Application of the EMM/SEMI 4200 Static RAM to the Intel 8080A Microprocessor"**
(4200)
Describes suggested logic interface to connect this 4K × 1 static RAM to 8080A MPU.
EMM/Semi Application Note S103A (4 pg.)

4 **"Application of EMM/SEMI 4K Static RAM to Motorola M6800 Microprocessor"**
(4200)
Describes suggested logic interface to connect this 4K × 1 static RAM to the M6800 MPU.
EMM/Semi Application Note S104 (6 pg.)

5 **"Checking Out the EMM/Semi 4200 in 2107B or 4060 Sockets"**
(4200)
Suggests circuit changes to permit acceptance of the 4200 static RAM in sockets wired for 2107B or 4060 Sockets.
EMM/Semi Application Note S102 (2 pg.)

6 **"TTL/MSI 9334 8-Bit Addressable Latch"**
(9334)
Describes operation and applications, including 16 and 32-bit addressable latches, 16-word by 4-bit memory, demultiplexer and decoder, 8-bit A/D converter and a 16-bit serial-to parallel converter.
Fairchild Application Note 220 (8 pg.)

7 **"Understanding the FIFO"**
(3351)
Covers 3351 FIFO operation, cascading, plus use in data rate buffering, parallel operation, and burst operation.
Fairchild APP 332 (8 pg.)

8 **"The MB8116 16K RAM"**
(MB8116)
Characterizes device and device operation. Discusses testing and use of the device in a 64K x 8-bit array.
Fujitsu AN202 (14 pg.)

9 **"The MB8227 4K RAM"**
(MB8227)
Characterizes device and illustrates use in a memory array.
Fujitsu AN200 (14 pg.)

RAMs (cont)

10 **"Designing Non-Volatile Memory Systems with Intel's 5101 RAM"**
(5101)
Describes internal circuits and operation of the RAM. Outlines circuit techniques for battery supported non-volatile operation. Describes use of the device with the MCS-40 microcomputer.
Intel Application Note AP-12 (28 pg.)

11 **"Which Way for 16k?"**
Considers various aspects of 16k RAMs including 64 and 128 cycle refresh and the advantages versus disadvantages of latching.
Intel Application Note AP-22 (7 pg.)

12 **"Applications of the Intel 2104A 4k RAM"**
(2104A)
Discusses operation of the device including power distribution and decoupling.
Intel Application Note AP-23 (13 pg.)

13 **"MOS Static RAMs"**
(2101, 2102, 2111, 2112, 5101)
Presents devices, failure mechanisms, testing methods and results.
Intel RR-9 (7 pg.)

14 **"2416 16K CCD Memory"**
(2416)
Describes device, failure modes, reliability tests and results.
Intel RR-11 (5 pg.)

15 **"Intel Memory Design Handbook"**
(1103, 2107A, 2107B, 2416, 3207A, 3222, 3245, 5101, 5235, 5244)
Combines various RAM, ROM, PROM and CCD application notes plus information on support circuits.
Intel $5.00 (265 pg.)

16 **"Operational Characteristics of the AMS 6002"**
(IM6002)
Describes the circuits required to interface the 6002 1K MOS RAM with TTL. Also discusses the internal and external circuit parameters that affect system performance.
Intersil AN-28 (4 pg.)

17 **"Designing Memory Systems with the AMS 6003 RAM"**
Provides the circuitry and timing information for building memory systems from the 6003 dynamic RAM.
Intersil AN-32 (9 pg.)

18 **"AMS7001 Basic Storage Module High Speed Memories"**
(IM7001)
Discusses AMS7001 storage module operation, backplane wiring, addressing scheme, and power requirements.
Intersil AN-35 (18 pg.)

19 **"Using the TM-200 Semiconductor Memory Card"**
(IM7001)
Describes this memory card using the AMS7001 RAM. Includes detailed diagrams.
Intersil AN-36 (22 pg.)

20 **"Layout Considerations Using 4K MOS RAMs"**
Discusses orientation, packing, drivers, power distribution, trace widths, signal levels, bypass caps, and bus bars.
Intersil AN-37 (4 pg.)

©IC MASTER 1979

MEMORY

RAMs (cont)

1 **"7005-4K RAM Application Information"**
(IM7005)
Provides a functional description of the 7005, and gives a typical design of a 16K x 16 system with timing information and suggested circuits.
Intersil AN-38 (7 pg.)

2 **"Battery Backup for Semiconductor Memory Systems"**
Provides information on the selection and application of batteries for backup power to both single-voltage and multiple-supply RAM systems.
Intersil AN-39 (6 pg.)

3 **"Memory System Reliability with Intersil 4K RAMs"**
(IM 7005, IM 7270, IM 7280)
Shows how memory system reliability can be predicted from device failure data and how, when necessary, system reliability can be increased through the use of error correction techniques.
Intersil AN-40 (7 pg.)

4 **"CMOS RAMs"**
(IM6508, IM6523, IM6524)
Provides a block diagram and describes the operation and interface requirements for these 256 × 1 and 1024 × 1 CMOS RAMs.
Intersil Application Bulletin M002 (8 pg.)

5 **"Considerations for Designing a High Density, Low Power Memory System"**
(MK4200)
Describes a 16K × 8 memory array using the MK4200 4K RAM and CMOS logic.
Mostek (3 pg.)

6 **"An In-Depth Look at Mostek's High Performance MK4027"**
(MK4027)
Describes operation of this 16-pin, 4K RAM.
Mostek (15 pg.)

7 **"Why 'Edge-Activated' Static Memories?"**
(MK4104, MK32000, MK36000)
Describes these devices with static memory cells and dynamic peripheral circuitry. Compares performance to fully static devices.
Mostek (4 pg.)

8 **"A MECL 10,000 Main Frame Memory System Employing Dynamic MOS RAMs"**
(MC10000 series)
Describes a dynamic RAM system that uses the MECL family for the control logic. Considers memory organization, layout rules, interfacing and generation of control signals.
Motorola AN-583 (20 pg.)

9 **"A Non-Volatile Microprocessor Memory Using 4K N-Channel MOS RAMs"**
(MCM6605, MC6800)
Describes the design of a 8192-byte non-volatile memory using the MCM6605 4K × 1 RAM and CMOS control logic to reduce the power requirement in the standby mode.
Motorola AN-732A (17 pg.)

10 **"The Design of an N-Channel 16K x 16-Bit Memory System for the PDP-11"**
(MCM6605, MC3450, MC3452, MC3459, MC3460)
Briefly describes operation of the MCM6605 NMOS RAM, the details, the design of a PDP-11 add-on mainframe memory using this device. The interface ICs and system performance are also discussed.
Motorola AN-740 (15 pg.)

RAMs (cont)

11 **"A CMOS Keyboard Data Entry System for Bus Oriented Memory Systems"**
(MC14419)
Describes a keypad to binary data entry system for placing data in RAM memories. It allows data to be entered through keystrokes, encoding 4-bits at a time.
Motorola Application Note AN-759 (4 pg.)

12 **"Semiconductor for Plated Wire Memories"**
See listing under (Digital) Interface. (Motorola)

13 **"A High Speed FIFO Memory Using the MECL MC10143 Register File"**
See listing under (Digital) High Speed Logic (Motorola)

14 **"A Method of Implementing Stacks with Existing Minicomputer Memory"**
Gives detailed description of a controller for a stack of programmable size up to 256 words for a 16-bit minicomputer with less than 16K of memory. Tells how stack size can be increased to 4096 words by adding ten ICs.
National AN-60 (4 pg.)

15 **"Using Tri State™ Logic for Rubber Band Memories"**
Describes the construction and use of scratch/pad memories to store data at a rapid rate and then release it as required. They serve as buffers between systems operating at different clock rates.
National AN-68 (4 pg.)

16 **"A Simple Power Saving Technique for the MM5262 2k RAM"**
(MM5265)
Describes method for decoding the clocks of unselected chips in a memory array to save power. Discusses application in 8K x 16 memory.
National AN-86 (4 pg.)

17 **"Designing Memory Systems Using the MM5262"**
(MM4262, MM5262)
Provides a detailed description of this 2048 × 1 PMOS dynamic RAM, operating instructions, and a diagram of a 16K × 10 memory using the device.
National AN-144 (14 pg.)

18 **"Pulsed Power Supply Operation of Selected MM2102 Static RAM"**
(MM2102, SM1480)
Covers method for operating selected 2102s (SM61480s) in a power-down mode.
National AN-172 (3 pg.)

19 **"MOS Scratch Pad/Content Addressable Memory System"**
Describes a 64-bit Scratch Pad/Content Addressable Memory using MOS devices. Includes circuit diagrams and discusses circuit operations.
National MB-11 (2 pg.)

20 **"Memory Systems Built with the Nortec 6002"**
(6002)
Describes circuits for the bit driver/sense amplifier required to interface the 6002 with TTL. Discusses external support circuit parameters and internal circuit operations that affect system performance.
Nortec Applications Note No. 28 (4 pg.)

©IC MASTER 1979

MEMORY

RAMs (cont)

1 **"Memory Systems Built with the Nortec 6002"**
(6002)
Describes use of this 1024-bit RAM in building a general purpose memory module with 425,984 bit capacity.
Nortec Applications Note No. 30 (14 pg.)

2 **"Printed Circuit Layout Considerations for Dynamic Memory Arrays"**
Gives P.C. layout guidelines for MOS dynamic memories (also applicable to standard TTL circuits.)
Nortec Applications Note No. 31 (2 pg.)

3 **"Designing Memory Systems with the Nortec 6003 RAM"**
(6003)
Describes operation of this 2048-bit RAM, including a discussion of memory timing, refresh control, array control signals, device output sensing, and array driver circuits.
Nortec Applications Note No. 32 (9 pg.)

4 **"Memory Systems Characteristics and Applications for the CD4061A"**
(CD4061A)
Describes basic device operation, application in memory systems, and testing including construction of an all CMOS memory tester.
RCA ICAN-6445

5 **"Driving the TMS4030 RAM Using the SN75363 or SN75322"**
(SN75322, SN7536, TMS4030)
Driving the TMS4030 chip enable clock with these ICs, switching speeds versus system size, general performance characteristics and performance comparisons are provided.
Texas Instruments Application Report CA-181 (7 pg.)

6 **"Memory System Design Utilizing TMS4050/4051 4k Dynamic RAMs"**
(TMS4050, TMS4051)
Reviews speed considerations, then steps through drafting a 4k dynamic RAM system. Two sample circuit examples are outlined.
Texas Instruments Application Report MOSA1 (56 pg.)

7 **"Introduction to Refreshing TI 4k Dynamic RAMs"**
(TMS2102, TMS4051)
Methods of refreshing dynamic RAMs are discussed. Compares static RAMs with dynamic RAMs also.
Texas Instruments Application Report MOSA3 (12 pg.)

8 **"Memory System Design Utilizing the TMS4044/4046, TMS4045/4047 4K Static RAMs"**
(TMS4044, TMS4045, TMS4046, TMS4047)
Provides general discussion of static RAMs and characteristics of devices. Two sample circuit examples are outlined.
Texas Instruments Bulletin S127R (44 pg.)

ROMs

9 **"Using the EA4600 ROM in M6800 Microcomputer Systems"**
(EA4600)
Takes up use of the ROM for use as memory, an I/O device, or as a data converter in the microcomputer system.
Electronic Arrays M-16 (14 pg.)

ROMs (cont)

10 **"ROM Application Note"**
(EA2708, EA3200, EA4700, EA8308A, EA8316E)
General discussion of ROMs and characteristics of each device.
Electronic Arrays (11 pg.)

11 **"Interfacing of the EA4900 16K ROM in an MCS-4 Microprocessor System"**
(EA4900)
Considers timing, power supplies, and logic levels for interfacing these devices.
Electronic Arrays (8 pg.)

12 **"Monolithic Diode Matrices"**
Describes programming and use of diode matrices. Applications: teletypewriter coding matrix, decimal decode for displays, nines complement-BCD, shift register matrices, and ROMs.
Harris Application Note 206 (16 pg.)

13 **"Intel Memory Design Handbook"**
See listing under (Memory) RAMs (Intel)

14 **"MCS2026-002"**
(MCS2026-002)
Describes connections to use this demonstrator version of the 16K (2048 × 8) dynamic ROM, which can be used as an adder, counter, encoder, decoder or shift register.
MOS Technology Application Note MCS2026-002 (8 pg.)

15 **"Code Conversion with Semiconductor Read Only Memories"**
(MCM4000)
Describes methods for converting data from binary to BCD and vice versa, from the Hollerith to the common 8-bit codes, and from one 8-bit code to another.
Motorola AN-506 (13 pg.)

16 **"Replacing Sequential Logic with ROMs"**
Describes design methods for using ROMs to replace sequential logic, that is to replace designs that would require random or combinational logic with feedback loops.
Motorola AN-722 (19 pg.)

17 **"The Systems Approach to Character Generators"**
(MM5240, MM5241)
Discusses use of MM5240 and MM5241 ROMs in character generation. Includes discussion of CRT raster scan displays, refresh memory modulation, control logic, bipolar compatibility, printing applications, and raster scan systems.
National AN-40 (12 pg.)

18 **"The Application of ROMs"**
(MM5203, MM5230, MM5232, MM5240)
Describes applications of read only memories in table look up, code conversion and generation, character generation, random logic generation, and microprogamming.
National AN-61 (12 pg.)

19 **"Saving ROMs in High-Resolution Dot-Matrix Displays and Printers"**
(MM5232, MM5240, MM5241, DM8596, MM8597)
Describes two-stage, column-generation approach called "intermediate coding" that saves more than 25% of ROM capacity when several ROMs are needed to store a font.
National AN-85 (8 pg.)

20 **"Custom ROM Programming"**
Gives forms for submitting truth tables for various National read only memories.
National AN-100 (8 pg.)

ROMs (cont)

1 **"Trig Function Generators"**
Instead of simply cascading ROM to increase resolution and accuracy of the look-up tables, this note describes interpolation techniques to increase trig function accuracy with less memory.
National MB-10 (2 pg.)

2 **"MOS Goes Bipolar"**
See listing under (Memory) Shift Registers. (National)

3 **"Fast Multipliers Using TTL Read Only Memories"**
(SN74182, SN74H183, SN74283, SN74284, SN74285)
Reviews fundamental algorithm of binary multiplication. Shows use of ROMs for multiplication, two's complement multiplication, and truncated multiplications.
Texas Instruments Application Report CA-172 (11 pg.)

Shift Registers

4 **"A Random Pattern Generator for Testing Digital Delay Elements"**
Describes the use of a linear feedback shift register for digital testing.
Advanced Micro Devices Application Note (3 pg.)

5 **"Applications of Dynamic Shift Registers"**
(1402A, 1403A, 1404A, 1405A, AM2802, AM2803, AM2804, AM2805, AM2806, AM2807, AM2808)
Discusses dynamic shift register storage in general, clock timing, circuits for clock drivers, interfacing with TTL, and recirculating registers.
Advanced Micro Devices Application Note (7 pg.)

6 **"Schottky TTL MSI Registers"**
(AM25S07, AM25S08, AM25S09, SN54S174, SN54S175, SN54S194, SN54S195, SN74S174, SN74S175, SN74S194, SN74S195)
Describes these 4 and 6-bit registers, their operation and applications. Contains logic diagrams and function tables. Applications covered include: longer words, use with dynamic shift registers, selective bus storage, use as a LIFO memory, psuedo random feedback, unique counting codes, permutation of inputs, and use in arithmetic.
Advanced Micro Devices Application Note (16 pg.)

7 **"High-Speed Shift Registers Use TTL RAMs and Counters to do all the Shifting"**
Describes how to build a high speed shift register using a RAM accessed by counters.
Advanced Micro Devices (2 pg.)

8 **"9338 8-Bit Multiple Port Register"**
(9338)
Describes the features of this device, the TTL/MSI equivalent and parallel serial expansion capabilities. Covers use as three address arithmetic unit with eight registers, and use in a first-in first-out memory.
Fairchild Application Note 294 (6 pg.)

9 **"The Logic Design of Shift Counters"**
See listing under (Digital) Counters. (Motorola)

10 **"Using Shift Registers as Pulse Delay Networks"**
See listing under (Digital) High Speed Logic (Motorola)
Microprocessors

Shift Registers (cont)

11 **"MOS Delay Lines"**
(MM506)
Describes the characteristics of static and dynamic shift registers used in delay lines. Discusses application as series/parallel delay lines and as substitutes for magnetic drum memories. Also covers specialized clocking techniques, such as two-speed clocking.
National AN-25 (8 pg.)

12 **"High Voltage Shift Registers Move Displays"**
(MM5081)
Describes use of the MM5081 high voltage shift register for driving gas discharge or lamp displays, i.e. moving messages or moving graphics.
National AN-44 (14 pg.)

13 **"Low Frequency Operation with Dynamic Shift Registers"**
Discusses operation of two forms of dynamic shift registers: ratioless and ratio. Recommends techniques, such as keeping clock amplitudes high, to design added margin into systems. Discusses temperature considerations, packaging.
National AN-55 (4 pg.)

14 **"Design Considerations of MOS Dynamic Shift Registers with Tri-State Outputs"**
(MM4012, MM4013, MM5012, MM5013)
Describes operation of MOS shift registers with Tri-State push-pull outputs. Includes discussion of the dynamic characteristics and maximum clock frequency.
National AN-65 (4 pg.)

15 **"MOS Goes Bipolar"**
Shows what voltages are required to combine MOS Shift Registers and Read Only Memories with bipolar devices. Presents interface diagrams.
National MB-12 (2 pg.)

16 **"Mask Programming Specializes MOS Shift Register Designs"**
(MM4007, MM4019, MM5007, MM5019)
Describes customizing MOS shift register bit lengths by programming a metalization mask used to manufacture these devices. Dual registers from 20 to 256 bits, and single registers from 40 to 512 bits are available. Describes single register taped output options.
National MB-14 (2 pg.)

17 **"COS/MOS MSI Counter and Register Design and Applications"**
See listing under (Digital) CMOS (RCA)

18 **"Static Shift Register Operating Curves"**
How to use the minimum/maximum clock pulse width operating curves included in National's static shift register data sheets.
National MB-15 (2 pg.)

19 **"Double-Clocking Cuts Standard Registers to Non-Standard Sizes"**
Describes a method of double-clocking for N data input periods to make the register appear shortened by N bits. When this is achieved, the clock rate resumes normal frequency.
National MB-16 (2 pg.)

20 **"HiNIL 375 Universal Shift Register"**
See listing under (Digital) HNIL/HTL (Teledyne Semiconductor)

©IC MASTER 1979

MICROPROCESSORS

Applications

1 **"A Musical S2000"**
(S2000)
Provides general description of the device programmed to generate musical frequencies and remember a set of twelve tunes. Includes schematic.
American Microsystems (4 pg.)

2 **"Application Techniques for the MCS-48 Family"**
(8748, 8048, 8355, 8243, 8755, 8155)
Introduces the MCS-48 family and describes the implementation of such subsystems as: analog input and output, the use of tables for function evaluation, receiving and transmitting serial code, and parity generation.
Intel Application Note AP-24 $1.00 (23 pg.)

3 **"CRT Terminal Design Using the 8275 and 8279"**
(8275, 8279, 8224, 8080, 8257, 8228, 8212, 8251, 2708, 2714, 2716)
Provides component descriptions and system design details needed to apply the 8275 programmable CRT controller and 8279 programmable keyboard/display interface in CRT systems. Flowcharts, sample code, and schematics included.
Intel AP-32 (57 pg.)

4 **"IM6100 CMOS Microprocessor Remote Data Station"**
(IM6100)
Describes a system capable of monitoring a number of different dc measurement channels under control of the IM6100.
Intersil DCE8001 (15 pg.)

5 **"Using Mostek F8 Microprocessor in a Scanned Seven-Segment Display Application"**
(F8)
Discusses the advantages of the F8 as a numeric display interface in μP based devices.
Mostek (16 pg.)

6 **"Using Mostek F8 in a Scanned Keyboard Application"**
(F8)
Discusses application of the F8 to eliminate hardware outside the processor to encode the keyboard. Uses a keyboard scanning technique.
Mostek (16 pg.)

7 **"A Floppy Disk Controller Using the MC6852 SSDA and Other M6800 Family Parts"**
(MC6852, M6820)
Discusses a floppy disk controller built using a synchronous serial data adapter as the primary data interface with the MPU. All non-data operation (seek, drive selection, etc.) in the controller are handled by a peripheral interface adapter.
Motorola AN-764 (17 pg.)

8 **"Data Acquisition Networks with NMOS and CMOS"**
(MC14433, MC6800)
Discusses an 8-channel data acquisition network using the MC14433 A/D converter and the MC6800 microprocessor.
Motorola AN-770 (11 pg.)

9 **"A Dual Processor System for Use in the EXORciser"**
Introduces dual processing and presents the design of a dual processor system for use in the EXORciser. In the system discussed, the μP's have control of a common bus on opposite phases of the clock.
Motorola AN-777 (13 pg.)

Applications (cont)

10 **"Interfacing and Controlling Digital Temperature Data Using the MC6800"**
(MC6800, MC6821)
Provides block diagrams, instruction set, and discussion of a temperature control system using the device.
Motorola AN-782 (4 pg.)

11 **"Simplify CRT Terminal Design with the DP8350"**
(DP8350, SC/MP)
Describes a low-cost CRT data terminal design based on the DP8350 CRT controller and SC/MP microprocessor. Features screen scroll, RS-232C interface, and adjustable band rate. Includes schematics, flowcharts, and PC board layout.
National Semiconductor AN-198 (10 pg.)

12 **"M6800 Microprocessor Application Manual"**
(MC6800)
Describes the use of the 6800 family of parts. Gives details of practical applications including the development of hardware and software, design of a point of sale terminal and interfaces to peripherals.
Motorola $25.00 (716 pg.)

13 **"Multiple Microprocessors in Instrument Systems"**
(IMP-8, IMP-16)
Discusses systems built with central microcomputers plus peripheral microprocessors to distribute intelligence. Illustrates concepts with a data acquisition and setpoint control system.
National AN-106 (8 pg.)

14 **"The IMP-8C as a Data Concentrator"**
(IMP-8C)
Describes the use of this microprocessor in data concentrator applications. Covers use with a full duplex modem, and the terminal controller interface.
National AN-113 (6 pg.)

15 **"Data Handling with the IMP-8"**
(IMP-8, IMP-16)
Covers basic concepts for transferring data from a memory to peripherals.
National AN-117 (4 pg.)

16 **"Microprocessor Mates with MOS/LSI Keyboard Encoder"**
(IMP-16)
Shows how to interface a keyboard to the IMP-16 microprocessor for text editing.
National AN-128 (6 pg.)

17 **"For Data Communications Systems: A Front-End Preprocessor for 16-Bit Minicomputer Hosts"**
General discussion of how preprocessing techniques used in large-scale host computers can be scaled down for application in mini-based systems.
National AN-131 (4 pg.)

18 **"The IMP-16 in Communication Applications**
(IMP-16)
Discusses communication processor functions, requirements for communications microprocessors and system considerations. Gives programming examples including status monitoring, data transmission, message routing, interrupt handling and error control.
National AN-134 (6 pg.)

MICROPROCESSORS

Applications (cont)

1 **"Communication Interfaces for the IMP-16"**
(IMP-16)
Describes the use of this microprocessor in leased line and switched line applications with the communications conforming to EIA standard RS232-C.
National AN-152 (13 pg.)

2 **"A Data Concentrator Using PACE"**
(PACE)
Describes the use of this microprocessor to take data from several slow speed lines and transmit it over one line.
National AN-164 (5 pg.)

3 **"Microprocessor Security Systems Made Easy"**
(SC/MP)
Describes program for sequencing through multiple inputs and actuating a simple output (relay, alarm, etc.) using NIBL.
National AN-174 (2 pg.)

4 **"SC/MP as an Analog-to-Digital Converter"**
(SC/MP)
Equations and diagrams for using the SC/MP as an A/D and D/A converter. Also lists sources of error that may result.
National AN-191 (3 pg.)

5 **"A Low Component Count Video Data Terminal Using the DP8350 CRT Controller and the INS8080 CPU"**
(DP8350, INS8080A, INS8250)
Describes a video data terminal system. Provides block diagrams and short descriptions of individual circuit elements as well as system schematic.
National AN-199 (10 pg.)

6 **"SC/MP Microprocessor Applications Handbook"**
(SC/MP)
Describes the SC/MP as a general purpose microprocessor covering applications, addressing, instruction set, implementing systems, buffering and interface. Covers use with A/D converters, keyboards, display systems, recorders and printers.
National $5.00 (160 pg.)

7 **"The CRT5027: Video Timer-Controller"**
(CRT5027)
Characterizes the device and explains how to program it. Provides examples for systems with 80 characters by 24 rows and 40 characters by 12 rows. Schematics and system block diagrams are included.
SMC Microsystems Application Note 1-1 (18 pg.)

8 **"TMS9900 Floppy Disk Controller"**
(TMS9900)
Illustrates use of the TMS9900 microprocessor system as floppy disk drive controller that interfaces to a RS-232C type terminal. Includes descriptions of hardware, diskette data transfer, and software.
Texas Instruments Application Report MOSA5 (68 pg.)

9 **"TMS9900 CRT Controller"**
(TMS9900)
Analyzes a CRT controller system that employs a TMS9900 microprocessor. Contains diagrams of the system and a software monitor routine.
Texas Instruments Application Report MOSA6 (32 pg.)

General

10 **"A Non-Volatile Microprocessor Memory Using 4K N-Channel MOS RAMs"**
See listing under (Memory) RAMS (Motorola)

General (cont)

11 **"Crystals: Specifications for Intel Components"**
Discusses crystal specifications, operation, and selection as they relate to use with various Intel components.
Intel AP-35 (4 pg.)

12 **"Microprocessors — An Introduction"**
Shows system components, defines terms and describes operation of an elementary computer system.
National AN-114 (4 pg.)

13 **"Increasing Throughput for IMP-16 Serial Input/Output"**
(MM5303)
Describes use of device to improve communication between microprocessor and peripheral with little increase in component count.
National AN-160 (7 pg.)

14 **"SC/MP Mates with Cassette Recorder"**
(SC/MP)
Describes a method of storing digital information on cassette tape.
National AN-163 (12 pg.)

15 **"Timesharing Users Manual"**
(IMP-8, IMP-16)
Gives user information to assemble IMP-8 or IMP-16 programs using Tymshare, Inc. services, or IMP-16 programs using the General Electric Computer Timesharing facility.
National (35 pg.)

Programming

16 **"Microprogramming Handbook"**
(2911, 2909, 29811, 2922, 29803)
Discusses microprogramming a bipolar processor. Includes sections on microprogram memory, sequencing, branching, jumping, and subroutines.
Advanced Micro Devices, $5.00 (44 pg.)

17 **"HM-6100 Microprocessor Basic 4K Software"**
(HM6100)
Describes the Digital Equipment Corp. PDP-8 software.
Harris Application Note HM003 (4 pg.)

18 **"HM-6100 ROM Based Subroutine Calls"**
(HM6100)
Describes two methods for returning to the proper program location after executing a subroutine.
Harris Application Note HM008 (4 pg.)

19 **"Series 3000 Cross Microprogramming System CROMIS Reference Specification"**
(3000)
Describes the CROMIS microprogramming system for the 3000 series computing elements. It supports the user who wants to generate microcode.
Intel $5.00 (77 pg.)

20 **"8080/8085 Assembly Language Programming Manual"**
(8080A, 8085A)
Primarily a reference manual, this manual describes the 8080/8085 instruction set, assembly language concepts, assembler directives, macros, programming techniques and interrupts.
Intel $5.00 (210 pg.)

©IC MASTER 1979

MICROPROCESSORS

Programming (cont)

1 **"PL/M-80 Programming Manual"**
(8080, PL/M-80)
Provides in readable format a complete description of the PL/M language as implemented by the PL/M-80 compiler.
Intel $5.00 (134 pg.)

2 **"MCS-48 and UPI-41 Assembly Language Manual"**
(8041, 8048, 8741, 8748, MCS-48, UPI-41)
Describes the assembly language for programming the MCS-48 and UPI-41 single device microcomputers. Covers procedures and controls for operating the assemblers to translate the source file into object code.
Intel $5.00 (192 pg.)

3 **"Series 3000 Microprogramming Manual"**
(3000)
Fundamentals of the 3000 series microprocessor and Cross Microprogramming System are described. Presents XMAS, XMAP languages and microprogramming techniques.
Intel $5.00 (73 pg.)

4 **"IM6100 CMOS Microprocessor Basic 4K Software"**
(IM6100)
Describes use of the Digital Equipment Corp. PDP-8 software.
Intersil Application Bulletin M003 (7 pg.)

5 **"ROM Based Subroutine Calls with the IM6100"**
(HM6100)
Describes two methods for returning to the proper program location after executing a subroutine.
Intersil Application Bulletin M008 (6 pg.)

6 **"DECUS PDP-8 Software Program Library"**
(IM6100)
Describes the Digital Equipment Computer Users Society (DECUS) as a source of programs written for the PDP-8 family and also usable with the IM6100.
Intersil DCAN001 (4 pg.)

7 **"6500 Programming Manual"**
(MCS6500 Series)
Describes the software aspects of the 6500 microprocessor family and related support devices.
MOS Technology $6.95

8 **"F8 Programmer's Guide"**
(F8)
Describes how to write programs for the F8 microprocessor system which cause the system to function as a discrete logic element.
Mostek $5.95 (304 pg.)

9 **"M6800 Evaluation Module Users Guide"**
(MC6800)
Provides general information, installation instructions, preparation and operating procedures for the M6800 evaluation module.
Motorola $5.00 (150 pg.)

10 **"M6800 Microprocessor Programming Manual"**
(MC6800)
Provides information needed to program the unit, discusses the instruction set, source language, assembler, simulator, Build-Virtual-Machine and HELP programs. Gives program examples.
Motorola $10.00 (303 pg.)

Programming (cont)

11 **"IMP-16 Programming Techniques"**
(IMP-16)
Discusses several aspects of the instruction set to enable programmer to code more efficiently. Includes discussion of subroutines, subroute parameter passing, recursive subroutines, as well as sample programs.
National AN-111 (6 pg.)

12 **"A Microprogram Development System"**
(IMP-16)
Describes the application of microprogramming to LSI processors and the advantages of a microprogram development system for hardware and software.
National AN-123 (6 pg.)

13 **"SC/MP Microprocessor Assembly Language Programming Manual"**
(SC/MP)
Covers an overview, Assembly Language, statements, programming techniques, macros and I/O formats.
National $5.00 (108 pg.)

14 **"SC/MP NIBL Reference Guide"**
(SC/MP)
Reviews NIBL programming language basic including necessary hardware, expressions and functions, I/O, and control statements. Appendices cover formal grammar, error messages, and BAGELs-a simple game.
National (26 pg.)

15 **"μPD379 Application Note"**
(μPD379)
Bisync and SDLC protocols using the μPD379.
NEC Microcomputers $1 (20 pg.)

16 **"Microprocessor Interface Software"**
(NC7033)
Describes how to interface the NC7033 MN05 non-volatile memory directly with an 8085 or 8080 microprocessor.
Nitron AN101 (28 pg.)

17 **"COSMAC Software Development Program on GE Mark III Time Sharing System"**
(CDP 1802)
Describes the COSMAC Software Development Package (CSDP) available for the GE Mark III time sharing system. Briefly covers the assembler and the simulator debugger which make up the package.
RCA ICAN-6656 (4 pg.)

18 **"Timesharing Manual for the RCA CDP1802 COSMAC Microprocessor"**
(CDP1802)
Discusses two assembly languages in the COSMAC software development package. Examines using the package, tells how to use it and develops a sample program.
RCA MPM-202 $10.00 (58 pg.)

19 **"Bit and Byte Testing Procedures"**
(2650)
Describes several methods of testing the contents of the internal registers.
Signetics AS51 (4 pg.)

20 **"General Delay Routines"**
(2650)
Covers software routines to generate time delays.
Signetics AS52 (3 pg.)

MICROPROCESSORS

Programming (cont)

1 **"Binary Arithmetic Routines"**
(2650)
Covers routines for binary addition, subtraction, multiplication and division.
Signetics AS53 (15 pg.)

2 **"Conversion Routines"**
(2650)
Covers Binary to BCD, BCD to ASCII, Hexadecimal to ASCII and vice versa.
Signetics AS54 (17 pg.)

3 **"Sorting Routines"**
(2650)
Describes several examples for implementing sort routines on the 2650 microprocessor. Techniques covered include the "bubble" sort, "search" sort, and "linear" sort. Flow charts and sample programs included.
Signetics AS56 (18 pg.)

4 **"2650 Binary Floating Point Routines"**
(2650)
Describes routines for performing addition, subtraction, multiplication, and division of binary floating point operands in normalized two's complement notation. Includes sample programs and flowcharts.
Signetics AS57 (13 pg.)

5 **"2650 BCD Floating Point Routines"**
(2650)
Describes routines for performing addition, subtraction, multiplication, and division of BCD floating point operands in normalized signed-magnitude notation. Provides sample flowcharts and programs.
Signetics AS58 (14 pg.)

6 **"Generating the Cyclic Redundancy Check in Software"**
(2650)
Describes software method of generating the CRC character using the 2650.
Signetics M23 (2 pg.)

7 **"2650 Initialization"**
(2650)
Covers start up procedures.
Signetics MP51 (1 pg.)

8 **"2650 Evaluation Printed Circuit Board"**
(2650)
Covers features and connections for this card level evaluation and design tool.
Signetics SP50 (14 pg.)

9 **"2650 Demo System"**
(2650)
Complete demonstration system when used with the 2650 PC1001.
Signetics SP51 (7 pg.)

10 **"Support Software for Use with the NCSS Timesharing System"**
(2650)
Covers a cross-assembler, cross-simulator and two utility programs (to load the 2650 and to burn PROMs.)
Signetics SP52 (7 pg.)

11 **"Simulator, Version 1.2"**
(2650)
Changes to the simulator.
Signetics SP53 (1 pg.)

Programming (cont)

12 **"Support Software for Use with GE's Mark III Timesharing System"**
(2650)
Presents a series of programs that provide on-line support for the development of programs to be run on the microprocessor. Programs include a cross assembler and a cross simulator.
Signetics SP54 (8 pg.)

13 **"Pipbug"**
(2650)
Program for the 2650 PC1001 demonstration card.
Signetics SS50 (13 pg.)

14 **"Absolute Object Format"**
(2650)
Describes the format of the absolute code.
Signetics SS51 (1 pg.)

15 **"Signetics Micro Assembler Reference Manual"**
(N2901, N3002, 8X02)
Describes this FORTRAN program developed as a design tool for writing microprograms. This microprogram defines his own assembly language, writes the microprogram, then assembles it to generate tapes to load memory. Suitable for most microprogrammed applications.
Signetics $4.00 (74 pg.)

16 **"An Introduction to RIO Text Processing"**
Presents for the beginning microcomputer user an introductory overview of the fundamentals of Relocatable Modules and I/O Management.
Zilog Application Note AN1 (24 pg.)

17 **"The Z80 Family Program Interrupt Structure"**
(Z80)
Describes the Z80 interrupt structure, which includes one non-maskable and three software maskable interrupt modes. Provides flow charts, timing diagrams, and circuit diagrams.
Zilog Application Note (31 pg.)

Systems

18 **"AM2914 Priority Interrupt Encoder"**
(AM2913, AM2914, AM2900, 9080A)
Provides data sheet information on devices. Outlines construction of a microprogrammable, bipolar, LSI interrupt structure for the 2900 and 9080A processors using the 2914.
Advanced Micro Devices (33 pg.)

19 **"The 8080A/9080A MOS Microprocessor Handbook"**
(8080A, 9080A, 8212, 8255, 9555, 8251, 9551)
Provides descriptions of the 9080A CPU and the associated clock generator and system controllers. Supplies data sheet information on various I/O interfaces, support circuits, and memories. An application section covers clock generation, memory system design, timing, interrupts, and multiplication.
Advanced Micro Devices, $7.95 (280 pg.)

20 **"A Microprogrammed 16-Bit Computer"**
(AM2901, AM2902, AM2914, AM2913, AM29705)
Presents computer design starting with the specification of a computer from a functional standpoint. Describes architectural units including the ALU, the Program Control Unit, and memory.
Advanced Micro Devices $5.00 (47 pg.)

©IC MASTER 1979

MICROPROCESSORS

Systems (cont)

1 **"An Emulation of the AM9080A: An example of a Microprogrammed Machine"**
(AM2901A, AM2909, 9080A)
Describes the emulation of an 8-bit μP built around four 4-bit slices and three microprogrammed sequences. Provides instruction set and clock cycle tables, block diagrams, a parts list, schematics, a printout of the microprogram definition, and a print out of the assembler statements and object code in an interleaved format.
Advanced Micro Devices $5 (47 pg.)

2 **"S2000 Extended Memory Applications"**
(S2000)
Shows four methods for connecting external memory to the S2000 single-chip microcomputer.
American Microsystems (5 pg.)

3 **"Microprocessor Systems Handbook"**
Explains μP hardware, the interaction of hardware and software, and the interfacing of μP's with A/D and D/A converters. Topics covered include memory addressing, I/O operations, and applications of various microprocessors.
Analog Devices $9.50 (218 pg.)

4 **"Analog Input/Output for Microprocessors Made Easy"**
(MP10, MP11, MP20, MP21)
Outlines features of devices and describes various ways each can be handwired to suit user configurations. Includes block diagrams of hookups with SC/MP, Z80, F8, 6800, 8080, 8085 and 9002 MPUs as well as discussion of memory mapped vs. accumulator I/O.
Burr Brown AN-87 (6 pg.)

5 **"Software Conversion of Analog Outputs to Analog Inputs"**
(MP10, MP11)
Discusses using the devices as an analog input system with diagrams illustrating hookups to the 6800 and 8080. Includes software program for each processor as well.
Burr Brown AN-88 (4 pg.)

6 **"F8 Microprocessor Application Manual"**
(F8)
Covers details concerning bit manipulation, RAM expansion of the I/O ports, subroutines and boot strap loaders.
Fairchild

7 **"PIC1650 8 Bit A to D Example Program"**
(PIC1650)
Provides diagram, flowchart, and example program for an A/D converter system using the device.
General Instrument Bulletin 1001 (3 pg.)

8 **"Advanced General Purpose Interface for Microcomputer Control Systems"**
(IOB1680, PIC1650)
Provides descriptions of both devices; one, a general purpose I/O buffer (IOB1680); the other, a peripheral microcomputer designed to take the load off a central processor. Supplies block diagrams of each and an instruction set summary for the PIC1650.
General Instrument Bulletin 1002 (5 pg.)

9 **"Static Memory Systems Utilizing the HM-6100"**
(HM6100)
Describes CMOS, nonvolatile CMOS and NMOS memory systems.
Harris Application Note HM004 (7 pg.)

Systems (cont)

10 **"HM-6100 CMOS Microprocessor Teletype Interface"**
(HD6402, HM6100)
Describes a teletype interface using the HM6100 and a UART.
Harris Application Note HM005 (7 pg.)

11 **"HM-6100 Operator Console"**
(HM6100)
Describes the 6900-CONTROL console for the prototyping system.
Harris Application Note HM006 (4 pg.)

12 **"HM-6100 CMOS Microprocessor Memory Extension"**
(HM6100)
Discusses a memory extension controller to increase the memory from 4096 to 32,768 words.
Harris Application Note HM007 (4 pg.)

13 **"8255 Programmable Peripheral Interface Applications"**
(8255)
Provides hardware and software information for this byte oriented I/O device. Examples cover character printer, paper tape and 8080-8080 interface applications.
Intel Application Note AP-15 $1.00 (32 pg.)

14 **"Intel MULTIBUS Interfacing"**
(MULTIBUS, 8080)
Describes this system bus structure, signals and characteristics. Includes electrical and mechanical information needed to build slave modules.
Intel AP-28 $1.00 (21 pg.)

15 **"Using the 8259 Programmable Interrupt Controller"**
(8259)
Reviews the concept of interrupts, then explains the 8259 as a component and shows its use in supporting a battery back up scheme for RAMs and a 78 level interrupt system.
Intel AP-31 (24 pg.)

16 **"Application Techniques for the 8085A Bus"**
(2117, 8085A, 8085A-2)
Discusses techniques for ensuring bus compatibility when using the 8085A and 8085A-2 microprocessor components. Covers interfacing the 8085A with the 2117 dynamic RAM, 8085A clock in vs clock out control timings, and bus loading limitations.
Intel AP-38 (31 pg.)

17 **"Simplify Your Dynamic RAM/Microprocessor Interface"**
(2104A, 2107A, 2107B, 2116)
Compares static and dynamic RAMs, then outlines elements of dynamic RAM/μP interface design including: refresh techniques, address multiplexing, memory overlap and transmission line effects.
Intel Application Note APR-1 $1.00 (65 pg.)

18 **"8080/8080A Microcomputer"**
(8080/8080A)
Presents device, failure mechanisms, testing methods and results.
Intel RR-10 (13 pg.)

19 **"8080 Microcomputer Systems User's Manual"**
(8080A)
Data sheets, architecture, timing requirements, and instruction sets for the MSC80 family.
Intel $5.00 (238 pg.)

MICROPROCESSORS

Systems (cont)

1 **"MCS-48 Microcomputer User's Manual"**
(8048, 8748, 8035, 8155, 8243, 8355, 8755, MCS-48)
Describes the system architecture, instruction set, programming, expansion, hardware and software examples, extensive data sheets.
Intel $5.00 (305 pg.)

2 **"UPI-41 User's Manual"**
(8041, 8741, 8243, UPI-41)
Describes this Universal Peripheral Interface device operation, instruction set, system design and interfacing.
Intel $5.00 (115 pg.)

3 **"MCS-85 User's Manual"**
(8085, MCS-85)
Describes this 8085 based system and peripheral components. Extensive coverage through data sheets.
Intel $5.00 (273 pg.)

4 **"Using the 8251 Universal Synchronous/Asynchronous Receiver/Transmitter"**
See listing under (Digital) Data Transmission (Intel)

5 **"Static Memory Systems for the IM6100"**
(IM6100)
Describes CMOS, nonvolatile CMOS and NMOS memory systems for the IM6100.
Intersil Application Bulletin M004 (14 pg.)

6 **"Teletype Interface for the IM6100 CMOS Microprocessor"**
(IM6100)
Describes a Teletype interface using the IM6100 and a UART.
Intersil Application Bulletin M005 (10 pg.)

7 **"IM6100 Operator Console"**
(IM6100)
Describes the 6900-CONTRL console for the prototyping system.
Intersil Application Bulletin M006 (17 pg.)

8 **"IM6100 CMOS Microprocessor Memory Extension"**
(IM6100)
Discusses a memory extension controller to increase the memory from 4096 to 32,768 words.
Intersil Application Bulletin M007 (6 pg.)

9 **"The ICL7104: A Binary Output A/D Converter for μProcessors"**
(ICL7104, ICL8052)
Describes designing with this 2 device A/D converter in detail. Discusses interfacing with and without handshakes, performance enhancement, and external auto-zero. Includes schematics, block diagrams, and graphs.
Intersil Application Bulletin A030 (14 pg.)

10 **"A Powerful Microprogram Controller: The 67110"**
(67110)
Describes features of the device including organization, internal interrupts, and memory expansion.
Monolithic Memories (5 pg.)

11 **"5701/6701: 4-Bit Expandable Bipolar Microcontroller"**
(5701, 6701)
Provides functional descriptions of the device, instruction set, timing and more.
Monolithic Memories Application Note (23 pg.)

Systems (cont)

12 **"6500 Hardware Manual"**
(MCS6500 series)
Describes the hardware aspects of the 6500 microprocessor family and related support devices.
MOS Technology $6.95

13 **"TIM Manual"**
(MCS6530)
Describes the program contained in the ROM portion of the 6530-004.
MOS Technology $5.00

14 **"F8 Microprocessor Hardware Support-Evaluation Kit"**
(F8)
Describes this kit and its use. Includes a sample program to acquaint the user with F8 machine language and shows how to program the kit.
Mostek (20 pg.)

15 **"Expanding Mostek's F8 Microprocessor External Interrupt Capability"**
(F8)
A detailed discussion of servicing control inputs in a F8 based system with emphasis on implementing interrupt driven systems.
Mostek (12 pg.)

16 **"Subroutine Nesting and Multiple Interrupt Handling Using Mostek's F8 Microprocessor"**
(F8)
Discusses the use and implementation of subroutines and interrupts as they apply to programming an F8 based system.
Mostek (16 pg.)

17 **"Z80 Interfacing Techniques for Dynamic RAM"**
(Z80, MK4027, MK4116)
Provides specific examples of interfacing 16-pin dynamic memories to the Z80 microprocessor. Includes timing diagrams and refresh information.
Mostek

18 **"Analog-to-Digital Conversion Techniques with the M6800 Microprocessor System"**
(MC1405, MC6800)
Describes successive approximation and dual ramp techniques for A/D conversion using the M6800. Gives flow diagrams, source programs and schematics. Appendix gives program for binary to BCD conversion.
Motorola AN-757 (35 pg.)

19 **"MEK6800D2 Microcomputer Kit System Expansion Techniques"**
(MC6800)
Covers techniques to add 8K or 16K of memory, I/O port expansion, power-up auto-reset, switch selectable monitor operation, and RS-232 or current-loop data terminal operation.
Motorola AN-771 (23 pg.)

20 **"A Simple High Speed Bipolar Microprocessor Illustrates System Design and Microprogram Techniques"**
(MC10801, MC10803)
Describes a complete bipolar LSI systems design using 10 ICs to perform 2's complement add, subtract, multiply and divide.
Motorola AN-774 (12 pg.)

21 **"M6800 Systems Utilizing the MC6875 Clock Generator/Driver"**
(MC6875)
Gives extensive design examples using the MC6875 in systems including slow or dynamic memories, and DMA (multiprocessor) applications.
Motorola AN-775 (20 pg.)

MICROPROCESSORS

Systems (cont)

1 **"The M10800 MECL LSI Processor Family — Three Descriptive Articles"**
(MC10800, MC6800)
Presents three articles about the device: "Get the Best Microprocessor Performance"; "The MSP: GTE Sylvania's Microsignal Processor"; "M10800 Microprogrammed Demonstrator". The first examines features of the processor; the second discusses a customer application; and the third describes a demonstrator treated as a peripheral to the M6800 system.
Motorola AN-776 (21 pg.)

2 **"Synchronizing Two Motorola MC6802s on One Bus"**
(MC6802)
Discussion, circuit and timing diagrams describing synchronizing two MPUs on the same data bus.
Motorola AN-783 (2 pg.)

3 **"M6800 System Microcomputer System Design Data"**
(MC6800)
Describes the family of parts including data sheets.
Motorola (165 pg.)

4 **"Device Operation and System Implementation of the Asynchronous Communications Interface Adapter MC6850"**
See listing under (Digital) Data Transmission (Motorola)

5 **"Applications of LSI Processors"**
(IMP-16)
Describes system architecture and operation of IMP-16C, 16-bit parallel processor with self-contained memory. Describes applications in a data communication link analyzer, in point-of-sales and in retailing systems.
National AN-98 (8 pg.)

6 **"Increasing the Number of Control Flags and Jump Conditions in the IMP-16C"**
(IMP-16C)
Describes simple and economical method of increasing the number of testable jump conditions and the number of control flags on the IMP-16C microprocessor.
National AN-101 (4 pg.)

7 **"Clock-Hold Schemes for the IMP Microprocessor Family"**
(IMP-8C, IMP-16C)
Presents scheme to extend the clock-hold function for additional periods of the main system clock, using the DM8570 shift register.
National AN-105 (4 pg.)

8 **"IMP-16 Interrupts"**
(IMP-16)
Describes various types of interrupts, including an overview of interrupt structure, example of interrupt request and service, multilevel and control panel interrupts.
National AN-107 (23 pg.)

10 **"IMP-16C Peripheral Interfacing Simplified"**
(IMP-16C)
Explores techniques for interfacing peripheral devices to the microprocessor.
National AN-124 (4 pg.)

11 **"IMP-16L DMA — What It Is and How to Use It"**
(IMP-16)
Discusses general theory of the DMA Bus, gives examples of priority expansion and data transfer.
Naitonal AN-135 (6 pg.)

Systems (cont)

12 **"Designing with the IMP Chip Set"**
(IMP-16)
Describes some of the major considerations in the implementation of 4 to 32 bit systems using the IMP series of devices. A 16 bit system is covered in detail.
National AN-141 (10 pg.)

13 **"Using a Microprocessor Beyond Apparent Speed"**
(IMP-16)
Covers the concept of cycle stealing, a technique in which a peripheral device communicates directly with memory or another peripheral device while the CPU is doing work other than using the data and address buses.
National AN-142 (6 pg.)

14 **"Number Cruncher (MM57109) Interface to Microprocessor"**
(MM57109)
Describes the MM57109 number cruncher unit which can perform most arithmetic functions found in complex hand-held calculators and interfaces either to a microprocessor or a random logic system. Provides schematics of interface logic and a flow chart for initialization of the device.
National AN-186 (10 pg.)

15 **"Clock Considerations For SC/MP-II"**
(SC/MP)
Shows several methods of providing a clock for the SC/MP-II.
National AN-188 (4 pg.)

16 **"Serial Data Transfers with SC/MP-II"**
(SC/MP)
Discusses serial data I/O data transfer using the SC/MP-II extension register.
National AN-190 (3 pg.)

17 **"Multiprocessing with SC/MP"**
(SC/MP)
Presents a brief analysis of the multiprocessing capabilities and characteristics of the SC/MP microprocessor based on measured data.
National Semiconductor AN-197 (6 pg.)

18 **"Bit-Slice Microprocessor Design Takes a Giant Step Forward with "Schottky-Coupled-Logic" Circuits"**
(IDM2900)
Covers a four-bit slice Schottky-coupled-logic design that combines the flexibility of the industry standard 2900 microprocessor architecture with advanced LSI processing.
National Semiconductor AN-203 (1 pg.)

19 **"GCP/P Product Description"**
(GCP/P)
Delineates the system, gives a functional description of the CROM and RALU devices, and presents the general purpose macroinstruction set. Appendices cover a microprogram to implement the IMP-16 instructions set and the use of the RALU status flag.
National (61 pg.)

20 **"POWER I/O CROM Technical Description"**
(IMP-16)
Describes the instruction repertoire and use of this unit which expands the variety of memory and input-output operations of the IMP-16.

(2651)
Shows application technique for the 2651 programmable communications interface.
Signetics M26 (2 pg.)

5 **"Low Cost Clock Generator Circuits"**
(2650)
Presents several crystal oscillator clock generator circuits that can be used with the 2650 microprocessor. All use standard TTL 7400-series logic elements.
Signetics MP52 (5 pg.)

6 **"Address and Data Bus Interfacing Techniques"**
(2650)
Discusses address and data bus drive requirements. Covers methods for increasing the system drive capability.
Signetics MP53 (8 pg.)

7 **"2650 Input/Output Structures and Interfaces"**
(2650)
Examines the use of the 2650 microprocessor's set of I/O instructions and the interface between the 2650 and I/O ports. Examples for both serial and parallel I/O are given. Provides diagrams and sample programs.
Signetics MP54 (19 pg.)

8 **"2650 Demo System"**
(2650)
Describes hardware base for use with 2650 CPU printed circuit board (PC1001).
Signetics SP51 (6 pg.)

Systems (cont)

9 **"The ABC Adaptable Board Computer"**
(2650)
Describes a low cost system development card for the 2650 microprocessor. Supplies PC board diagram, assembly drawing, and memory organization map.
Signetics SP55 (14 pg.)

10 **"Application Memo to Control Store Sequencer 8X02"**
(8X02)
Presents a functional description and gives microprogramming system suggestions.
Signetics Bipolar Application Memo 3 (7 pg.)

11 **"Interfacing the 8700 A/D Converter with the 8080 μP System"**
(8700, 8701, 8702)
Presents use of the 8700 A/D converter with the 8080 microprocessor. Provides techniques for interfacing the two and methods for handling multiple converts with increased throughput.
Teledyne Semiconductor AN-8 (6 pg.)

12 **"Minimum System Design TMS 9900 16-Bit Microprocessor"**
(TMS9900)
Explains system design, system performance, and minimum system configuration.
Texas Instruments Application Report (CA-184A (7 pg.)

13 **"TMS 5501 I/O in TMS 8080A μP Systems"**
(TMS5501, TMS8080A)
Describes operation and use of this input/output controller.
Texas Instruments Application Report (CA-185A (18 pg.)

14 **"Software Design for Microprocessors"**
(SBP0400, TMS1000, TMS5501, TMS8080, TMS9900)
Presents basic microprocessor fundamentals. Includes such topics as basic terms, basic machine architecture, instruction sets, and programming. Sample design problems are examined.
Texas Instruments $12.50 (385 pg.)

15 **"Interfacing 16 Pin Dynamic RAMs to the Z80A Microprocessor"**
(Z80)
Presents the major design considerations, and a design example, for interfacing 16-pin dynamic RAMs, both 4k and 16k, to the Z80 and Z80A. Supplies circuit and timing diagrams.
Zilog Application Note (27 pg.)

DATA ACQUISITION SYSTEM INTERFACE TO COMPUTERS

INTRODUCTION

The need of interfacing several analog data channels to computers has not escaped the attention of the data system firms. There are presently available a number of data acquisition units (DAUs) which will directly interface 8-64 analog data channels to one or more types of computers or microcomputers, and more appear on the market almost monthly. Some of these DAUs are even constructed to plug into the mainframe of the computer for which they are designed. Nearly all of these commercially available DAUs are of more or less conventional design, operating in either a random channel address or sequential address mode. Figure 1 shows a typical functional diagram of such a random channel address DAU. Its advantages are simplicity, straightforward design, and comparatively low cost (depending upon performance and special features). In operation, the computer addresses a specific channel, the analog multiplexer (MUX) is set to the desired channel, a sample and hold (S&H) circuit acquires and holds the analog signal, an analog-to-digital converter (ADC) digitizes the signal, a ready signal is returned to the computer, and the data is presented to the data bus via TRI-STATE® bus drivers. If the data is 12-bit and the data bus is 8-bit, the data word must be broken into two bytes and addressed separately. The prime disadvantage of these DAU designs is that the computer must either enter a wait mode while data is readied or it can proceed with its assigned task, watch for a data-ready flag signal, and return for the data.

From the standpoint of microprocessor system design, it is clearly desirable to access input data as if it were main memory. It is further desirable that input data access time be equivalent to that of main memory so that the processor need not enter a wait mode while data is readied for input. One attractive method of accomplishing this is to use one A/D converter (of a type containing TRI-STATE output data latches) on each input data channel. Henceforth I shall refer to this as parallel conversion. Figure 2 shows such a system containing only an address decoder and multiple A/D converters with all outputs wired in parallel onto the data bus. Note the absence of S&H modules.

The advantages of this DAU system are the immediate data access and its simplicity. However, one's first thought on considering a parallel-conversion system might be that the cost of ADCs would exclude their consideration on a one-per-channel basis. But, although this may have been true in the past, currently available monolithic and hybrid ADCs are priced such that this system concept is entirely feasible. Furthermore, the converter price trend is definitely downward as more monolithic units are released, so the economic feasibility can only improve in the next few years, thus extending the application to an ever larger segment of the market. The ideal converter for use in the system of Figure 1 includes converter, comparator, and buffered TRI-STATE output data latches in one package. The unit would

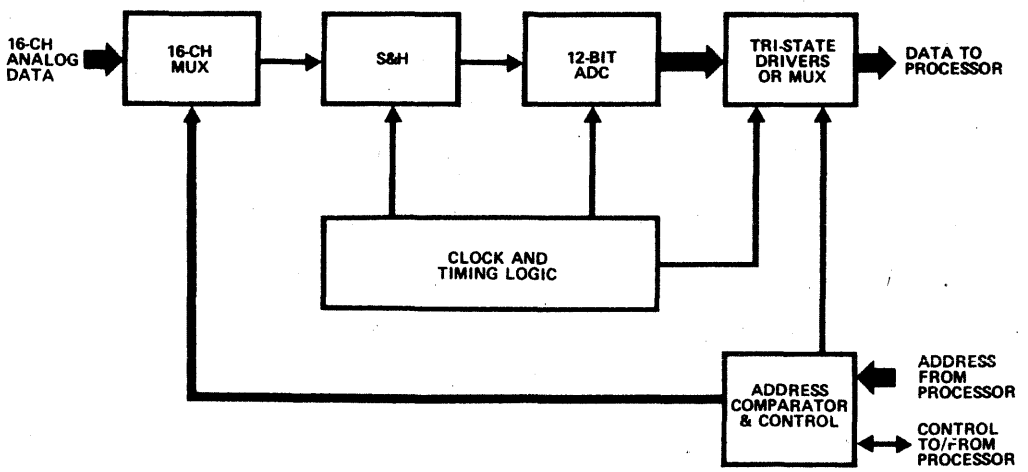

FIGURE 1. Random-Addressed Multiplexed DAU

©IC MASTER 1979

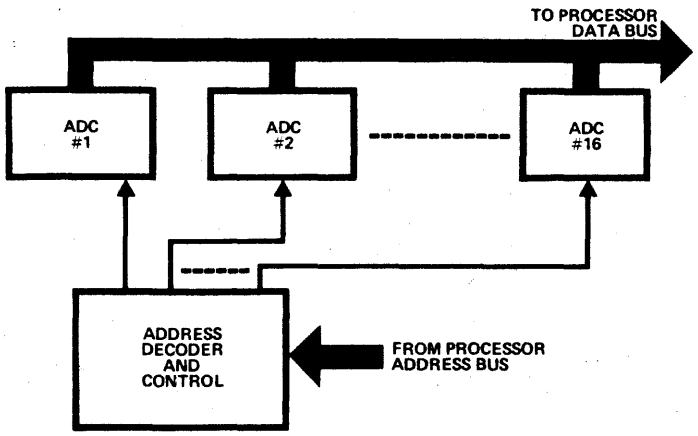

FIGURE 2. Parallel Data Conversion Concept

operate in the continuous convert mode with the last data remaining in the output latches until the next completed conversion shifts new data into the latches. Valid latest data is thus always available for readout on the data bus except for a brief period when the data is being updated. In contrast, a converter without buffered output latches does not hold data after a start-conversion signal and so must be operated in the command mode with a wait for data after the converter is started.

In spite of the advantages of the parallel-conversion DAU, there is (at present ADC prices) a more cost-effective way of providing the same immediate memory-access mode of operation, particularly for 12-bit data. Figure 3 shows a multiplexed DAU with self-contained memory which will interface to computer systems in the memory-access mode without a wait period.

The total package count of this system is lower than that of the parallel-conversion DAU, the cost/channel is lower, and the required space and power is lower. A disadvantage is that the accessed data may be as much as 800μs old, compared to a possible 1-4μs with parallel conversion. The key to the success of the system is the dedicated on-card 16x12 RAM. Neither does the system require a special ADC design with buffered output data latches. Main memory could, of course, be used instead, but then some machine time would be utilized as memory write time. This way, the latest data is always ready and waiting in the DAU (peripheral) memory, and software is considerably simplified.

Before exploring any of the three systems in more detail, it is worth considering the system limitations, the economics, and the probable market segment which could be served by the three types of DAU described.

The required data bandwidth has obvious strong effects on system cost and realization. The bandwidth of a sampled data system is limited by Shannon's sampling criterion and other practical considerations to, say,

$$f_{max} = \frac{1}{5\, t_{conversion}}$$

which is 4kHz for a 50μs conversion cycle time. However, when no S&H module is used ahead of the ADC, as in a parallel-conversion DAU, conversion must take place within the time it takes the input signal to change by ±½ LSB or 1 part in 2^{n+1}. For sine waves, the maximum rate of change is determined as follows:

$$\frac{\Delta v}{\Delta t} = \omega v_{pk},$$

but

$$v_{max} = \frac{2\, v_{pk}}{2^{n+1}}$$

therefore

$$\frac{2\, v_{pk}}{2^{n+1}\, \Delta t} = 2\pi\, f_{max}\, v_{pk}$$

and

$$f_{max} = \frac{2^{-(n+1)}}{\pi\, t_{conv}}.$$

For the same 50μs conversion time and an 8-bit accuracy requirement of ±½ LSB, f_{max} is 12Hz. Figure 4 compares data bandwidth of 8- to 14-bit systems with and without S&H. The economic effect of adding an S&H module ahead of each ADC in a parallel-conversion DAU is obvious (possibly doubling the cost per channel of an 8-bit system) as is the cost of significantly increasing conversion speed except by use of tracking converters (advantageous only in parallel-conversion systems).

The conventional random-addressed DAU can serve any part of the data acquisition market where the task of the computer is light enough that the system can afford to enter a wait mode at data request. This wait period can be as low as 10-20μs if sufficient money is available for fast S&H circuits and fast ADCs, as high-speed components are traditionally quite expensive. Lower cost systems may require a wait period of 100-200μs before data is available. At the expense of more complex software, the computer could remain busy during the period of data preparation, and would return for the data when it was made ready. The data bandwidth may be deter-

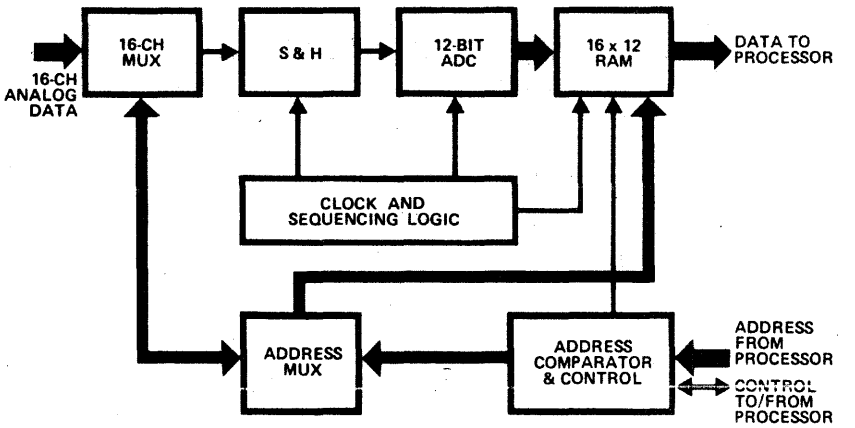

FIGURE 3. Multiplexed Immediate-Data-Access DAU

mined from Figure 4. Sixteen channels of 10Hz data could be available if each channel were sampled once every 20ms. This is a data throughput rate of 16ch x 1/20ms = 800Hz. The higher cost DAUs of this type have capability of 50-100kHz throughput rates. However, if the computer waits while data is made ready, it will be completely occupied with gathering data when the maximum throughput rate is utilized.

The parallel conversion DAU without S&H circuits is destined to operate on low-bandwidth data as indicated in Figure 4. To be economically feasible the ADCs must be of low cost. This means an 8- or 10-bit successive approximation register (SAR) or a 12-bit integrating monolithic ADC must be used. New ADC designs using tracking counters could increase data bandwidth capability over that possible with SAR counters. For purely economic reasons, then, use of parallel-conversion DAU systems will be limited to low bandwidth data – 10-30Hz on 8-bit, 2-5Hz on 10-bit, and less than 1Hz on 12-bit systems. These bandwidth figures for 8- to 10-bit systems could be considerably improved, say by 8-10 times, if tracking converters were used in place of SAR converters. This definitely suggests that there is a need for low-cost tracking converters. Note that S&H circuits are not needed in the parallel-conversion systems.

The multiplexed DAU with memory can serve any segment of the data market. It is limited in bandwidth

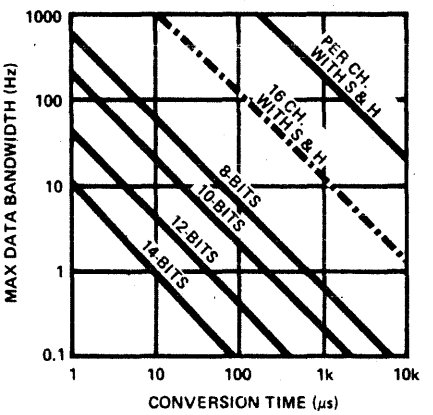

FIGURE 4. Data Bandwidth vs. Conversion Time

or data throughput rate principally by the S&H and ADC operating times, its cost per channel is only slightly higher than that of the conventional DAU, and it allows the computer to operate in the most efficient manner.

A comparison of system costs must include the following for a 16-channel system.

Parallel Conversion	Random Addressed Multiplexed	Multiplexed with Memory
16 A/D Converters	1 A/D Converter	1 A/D Converter
16 Anti-Aliasing Filters	1 S&H Module	1 S&H Module
Control Circuits	1 16-Channel Multiplexer	1 16-Channel Multiplexer
Additional power for extra converters	16 Anti-Aliasing Filters	16 Anti-Aliasing Filters
Lower data bandwidth	More complex control circuits	1 16x12 RAM
Simple software	Longer data access time	More complex control circuits
	Possibly more complex software	High-speed data access
		Simple Software

©IC MASTER 1979

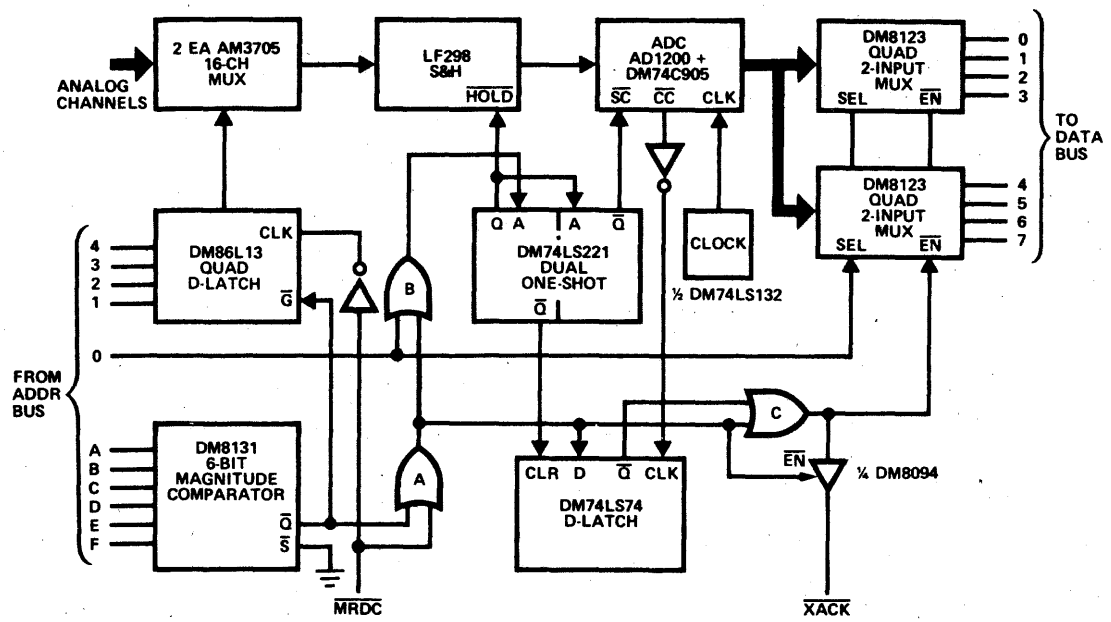

FIGURE 5. Conventional DAU for 8080

The future trends in DAU designs will include an increasing number of parallel-conversion DAUs, especially as cost reductions appear on monolithic ADCs with TRI-STATE output circuits (or latches). We should also start to see some tracking converters in the low-cost monolithics with TRI-STATE output data latches. Expect to see multiplexed DAUs with memory appearing in the near future. Its simplicity from a circuit and software standpoint cannot long go unnoticed.

RANDOM ADDRESSED DATA ACQUISITION UNIT

A conventional, random-addressed, 16-channel, 12-bit DAU is diagrammed in Figure 5. The analog section contains a 16-channel analog multiplexer, a sample-and-hold block, and a 12-bit ADC. A more complete system might contain a differential multiplexer and/or a differential (or instrumentation) amplifier preceding the S&H block. The data output circuits are arranged to interface an 8-bit data bus as found on an 8080 or 6800 microcomputer (μC). Since the data word is 12 bits, the μC must accept it in two 8-bit bytes. Normally the μC would address the DAU with two consecutive address locations corresponding to a 0 and a 1 at the address LSB to load the two bytes of data. The DM8123 multiplexers are ideally suited to this use. They have TRI-STATE output circuits, and the channel-select input may be directly driven from the address LSB. If a 16-bit address bus were being interfaced, such as in the PACE μC, the output multiplexers would be replaced with DM8097 or equivalent TRI-STATE output buffers (see Figure 11). In both instances, low-power versions of these parts, the DM81L23 and DM80L97, could be used to drive a lightly loaded data bus.

The address decoding is accomplished with a DM8161 6-bit magnitude comparator looking at the six most significant address bits. These 6 bits are compared with an address code hard wired into a DIP header which can be different for each DAU card in a system. Comparing only 6 address bits allows a possible 64 cards in a single system and uses up to 64 pages of memory position. If this is not satisfactory, two address comparators ORed together (DM8163) could select from 12 bits of address. The magnitude comparator(s) plus the four address lines to the 16-ch MUX make up the complete address decoding. The output of the magnitude comparator(s) indicates when this DAU has been addressed, and the four address lines to the MUX select the 1-of-16 channels of this DAU.

This circuit is designed to interface the 8080 μC. Thus, a memory read command $\overline{\text{MRDC}}$ must be received, and an acknowledgement $\overline{\text{XACK}}$ must be issued to indicate when data is ready. Operation is as follows: A valid address on address lines A-F causes comparator output $\overline{Q}$ to go low. This gates the inputs of the quad D latch to accept the 1-of-16 address word from address lines 1-4. At the occurrence of $\overline{\text{MRDC}}$ the address is clocked into the quad D latch and presented to the 16-ch MUX which selects the addressed channel. When $\overline{Q}$ and $\overline{\text{MRDC}}$ are both low, the output of OR gate A goes low, which enables the XACK signal buffer. If the address LSB is 0 (byte 1 of a 2-byte data request), OR gate B output goes low to trigger a one-shot.

The one-shot circuits are a simple means of timing the sample period and the converter start commands. There are other methods (see Figure 15) of accomplishing this timing without the hazards associated with one-shot circuits; however, the simplicity of this scheme lends itself to easy understanding of the timing required. The first one-shot generates a sample pulse of 5-30μs as required for the S&H to acquire and settle to 0.01% of value. Its $\overline{Q}$ output presets the single D latch ($\overline{Q}$ = 1). The trailing edge of this pulse returns the S&H to HOLD condition and triggers the next one-shot to generate a start conversion command of about 3μs. When the ADC completes conversion, its $\overline{\text{CC}}$ output goes low, thus clocking a 0 into the single D latch to reset its Q output low. Both inputs to OR gate C now being low will enable the output MUX and return a low on the XACK

line indicating to the μC that data is ready. Address LSB = 0 selects the 8 LSB of the data word for presentation to the data bus. A subsequent address with LSB = 1 selects the 8 MSB of the data word, but will not trigger the one-shot or preset the D latch because the output of OR gate B will remain high. Since the output of OR gates A and C will be low, $\overline{XACK}$ is returned and the output MUXs are enabled to present byte 2 of the data word on the data bus. When $\overline{MRDC}$ returns high, the output circuits are disabled. If the 6-bit comparator does not see a valid address, no action is taken by the DAU.

This represents the simplest possible DAU for interfacing to computers. The interface to the 8080 is one of the simplest. Only minor modifications are required to interface, for example, the 6800 or PACE μCs (see Figures 9 and 11). The only timing anomaly in the logic system shown is that when the $\overline{XACK}$ buffer is enabled there will be a 10-40ns pulse of 0 output. The computer, however, does not act on an XACK signal at this time and so will enter a wait mode until $\overline{XACK}$ is returned later on.

The analog signal section has purposely been omitted from this discussion of interfacing to processors because its details will depend upon analog signal levels, the possible requirement for differential channels, the possible need of an instrumentation amplifier following the multiplexer, and S&H timing requirements. The analog section of the DAU may be made up of various components, depending upon the required performance and operating conditions. A pair of 8-channel multiplexers will give the flexibility of connecting as differential 8-channel or as single ended 16-channel whereas a single 16-channel MUX with space and wiring on the board for another 16-channel MUX would allow for either 32 channels or 16 differential channels. A pair of AM3705s could be used for lowest cost where analog signals are no greater than ±5V. The S&H circuit could be monolithic LF198, hybrid LH0023, LH0043 or LH0053, made up of individual discrete and integrated circuits, or it could be any of several available modules.

The ADC used in this system may be of a conventional design with speed and accuracy being the only important technical considerations. No special TRI-STATE output or output data latches are needed as the data is latched in the register until a new start conversion (SC) command is given. The ADC could be made up of an AD1200 ADC building block plus DM2504 or MM74C905 successive-approximation register, it could be an AD1210 plus LH0071 reference and appropriate MOS-TTL and TTL-MOS buffers, or it could be any one of a number of other ADCs on the market.

Total power is about 2.8 watts and cost is about $9.50 per channel for components as indicated in Table 1. Note that output drivers are standard TTL circuits whereas low power TTL may be used for lower power dissipation where a lightly loaded data bus is to be driven.

PARALLEL-CONVERSION DATA ACQUISITION UNIT

Parallel data conversion is likely the simplest possible μC data system concept which will effect immediate access to latest input data as if it were main memory. It may be treated as main memory by the processor and is only slightly more complex than the simplified system of Figure 2. The individual ADCs in Figure 2 include TRI-STATE output for direct wire ORing on the data bus. However, to make each capable of driving a heavily loaded system bus would require significant and unnecessary power dissipation in each ADC. Accordingly, except in minimally loaded systems, a separate set of TRI-STATE TTL output data buffers would be added to Figure 2. Small differences in the address decoder and control circuits will exist, depending upon which μC system will be used.

The control circuits are exceptionally simple, being required primarily to accept the memory read command and to return a memory ready signal. The most complex part of the control circuits is that required of μC systems which accept data in two 8-bit bytes rather than in one 16-bit byte, yet even this added complexity is minimal.

Table 2. Microprocessor System Characteristics

	8080	PACE	6800	SC/MP
Address Word Length	16-bit	16-bit data/address bus	16-bit	12- or 16-bit
Data Word Length	8-bit		8-bit	8-bit
Address & Data Polarity	All chips are 1 = true; however, if Intel system bus drivers and receivers are used, 8080 system data and address bits are 0 = true.			
Address Strobe	None	NADS = 0 to set memory address latches	VMA = 1 (concurrent with)	NADS = 0
Memory Read Strobe	MRDC = 0 to read data	IDS = 1 to input data	R/W = 1 to read data	NRDS = 0 to read data
Maximum Clock Rate	2MHz	2MHz	1MHz	1MHz

Since μC systems differ somewhat from one another, it is worth our effort to look at the hardware and software details and the system timing requirements of several of them when considering a DAU interface. From this consideration we can establish the desired function and characteristics of the ADCs, DACs, address decoders, control components, and μC interface signals. The following exercises include interfacing parallel conversion DAUs of 8- and 12 bits to the Intel 8080, the National PACE, and the Motorola 6800 microcomputer systems. Interface to other systems such as National's SC/MP will be similar. All request, control, and answer signals are considered along with the required signal polarities and timing relationships. Table 2 summarizes the important characteristics of these three systems.

8080 Interface

The 16-channel, 8-bit parallel-conversion DAU shown in Figure 6 will interface with an 8080 μC system without a wait period in the memory-read cycle. This system can be built with existing components for about $10 per channel. It is a minimal system, capable of driving only a lightly loaded data bus, as the MM5357 ADCs can drive but a single TTL load. When heavier loads must be driven, two quad TRI-STATE output buffers will be needed. The address decoding uses a 4-line to 16-line decoder which selects the addressed channel from the four least significant (LSB) of address bits. A 6-bit address comparator compares the six most significant (MSB) address bits with a code hard-wired into the code-select-header. The comparator output gates the 4:16 decoder only if the proper memory page (1 of 64) is addressed. The comparator output, gated by the memory read command $\overline{\text{MRDC}}$, inhibits the clock to prevent data change in the output latches during the data access period. Concurrence of the correct address and $\overline{\text{MRDC}}$ also returns a data-ready acknowledgement to the μC via the TRI-STATE output of a buffer. No other logic is required; however, inverters are necessary in the ADC enable lines due to a sense mismatch in the 4:16 decoder output and the ADC enable inputs. The system is truly as uncomplicated as indicated in Figure 2.

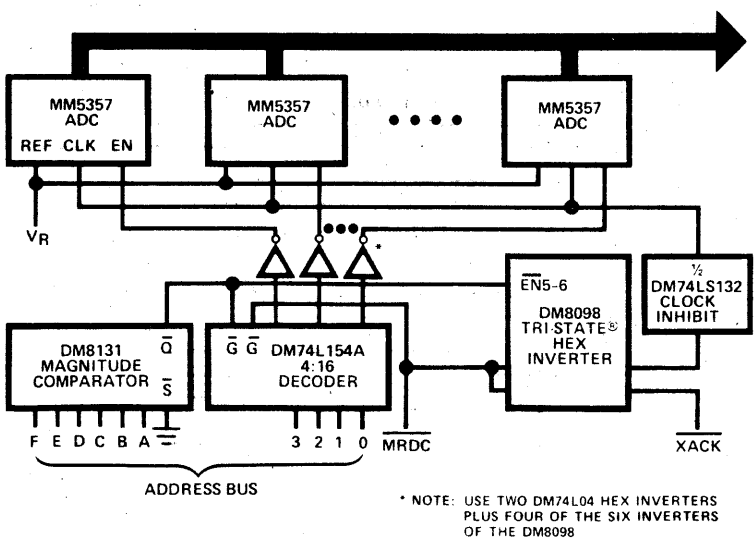

FIGURE 6. 16-Ch, 8-Bit Parallel-Conversion DAU for 8080

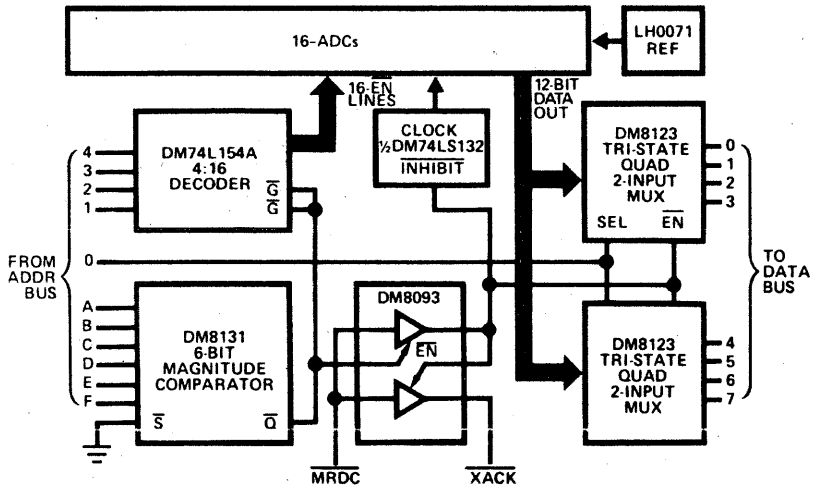

FIGURE 7. 16-Ch, 12-Bit Parallel-Conversion DAU for 8080

As 12-bit data is likely of greater interest in the market, the remainder of the discussion will consider the logic necessary to handle 12-bit data. Accordingly, Figure 7 shows a 16-channel, 12-bit parallel-conversion DAU for the 8080. No part number designation appears on the ADCs because they are hypothetical units possessing the characteristics considered desirable in this application. The converters contain the DAC switches, ladder network, comparator, up/down counter (for tracking conversion), control logic, and TRI-STATE buffered outputs. They operate continuously with the output data buffer updated at the end of each conversion. Such a converter containing CMOS logic could settle in less than 1-4 μs (after an initial but longer acquisition period) without being costly to construct, and would thus provide 12-bit accuracy to ±½ LSB at a data bandwidth of 10-20 Hz. A single external buffered reference could suffice for all converter channels. An external gated clock could drive all converters. Address decoding is the same as outlined for the 8-bit system. The LSB address bit is used to select byte 1 or byte 2 of the 12-bit output data word by means of the two DM8123 quad, TRI-STATE, 2-input multiplexers. Address bits 1-4 are decoded into 1-of-16 select bits to enable the TRI-STATE output of the selected ADC. Since the 1-of-16 output select of the DM75L154A decoder is 0 true, it is desirable that the ADC enable input be 0 true. Otherwise, 16 inverters would be required. The control timing may be considered in reference to the 8080 timing requirements shown in Figure 8.

The DM8131 address comparator provides an output to gate the 4:16 decoder and to enable the DM8093 quad TRI-STATE line driver. This occurs (+30 ns) only if the address is valid for this data card. If the address is valid, the 4:16 decoder accepts the address and the DM8093 is set to accept the MRDC command at inputs 5 and 6 (+250 ns). The decoder output to the ADC enable lines is available (+180 ns), and valid data is available from the selected ADC (+330 ns). As the data card must return a data ready signal (+440 ns) to prevent extending the memory access cycle, the DM8093 transmits the $\overline{\text{MRDC}}$

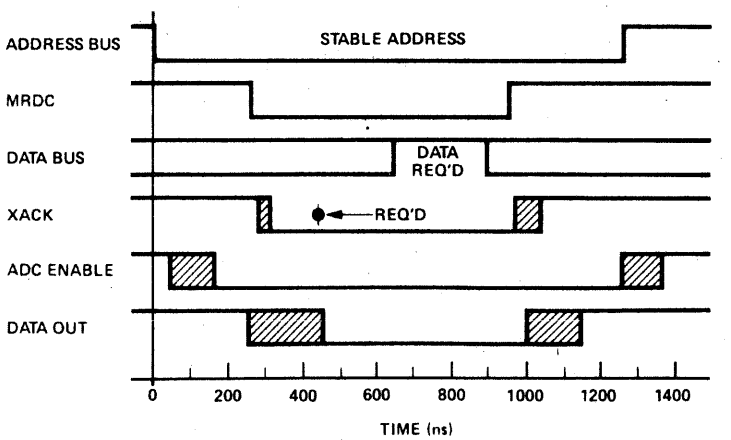

FIGURE 8. Timing and Control for 8080

©IC MASTER 1979

back out to the μC on the XACK line (+300ns) in advance of the time required. A 0 is placed on the XACK line for the duration of the MRDC command. The MRDC signal also enables the output multiplexer enable lines (+300ns) via the DM8093. This signal also interrupts the clock drive to the ADCs to prevent a change in data output during the remainder of the memory read cycle. A desirable built-in design feature of the ADC for this application might be a clock inhibit or data transfer inhibit operating from the $\overline{EN}$ input. Valid data is present on the data bus (+460ns) at least 200ns before it is required. Valid data remains stable until the end of the MRDC command when XACK and data output lines return to their normal high-impedance states.

Data is placed on the data bus in two 8-bit bytes as controlled by the LSB address code. A 0 selects the 8 LSB data, and a 1 selects the MSB data. Two consecutive memory addresses will then read the entire data word in two bytes. As there are only 12 data bits, zeros are placed on the remaining data lines. For 2s complement binary data coding of ± input analog signals, the 12th bit would be inverted and extended to the remaining data lines so that signals would appear as valid data to the microprocessor.

Total address decode, control, clock, and output drive logic circuitry is contained in six DIP circuits (only one of 24 pins). To this must be added a code-select header, a reference, and 16 converters. Total power required is 4.2 watts for 16 channels of 12-bit data from ±5V analog signals of 10Hz bandwidth (see Table 3). Low Power TTL output drive capability would reduce power drain by 370mW. Total cost of parts (assuming a future price of $25/ADC) would run to about $26 per channel (see Table 4).

6800 Interface

For other μC systems, the logic will change slightly. Figure 9 shows the logic section of the DAU of Figure 7 modified as necessary to interface with the 6800 μC. The 6800 timing and control signals are shown in Figure 10. With the 6800, the address information, the valid memory address VMA signal, and the read/write W/R signal all come up approximately simultaneously and remain for about one clock period of 1μs (min.). The data need not appear on the data bus until 100ns thereafter. The valid address decoding is accomplished by ANDing the VMA and R/W signals together in a TRI-STATE 2-input AND gate. When enabled by the comparator output, this gate returns a READY signal to the μC and enables the output multiplexers. The appropriate data byte is selected by the LSB address bit as with the 8080 system. The necessary 10ns data hold time is provided by the ADC and output multiplexer disable delays. The remainder of the DAU is identical to that of Figure 7. Cost and power required are also similar to those of the 8080 system interface.

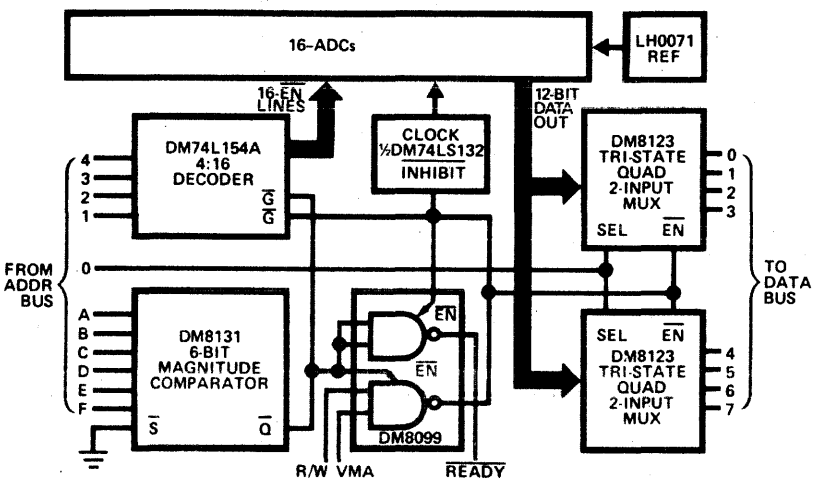

FIGURE 9. 16-Ch, 12-Bit Parallel-Conversion DAU for 6800

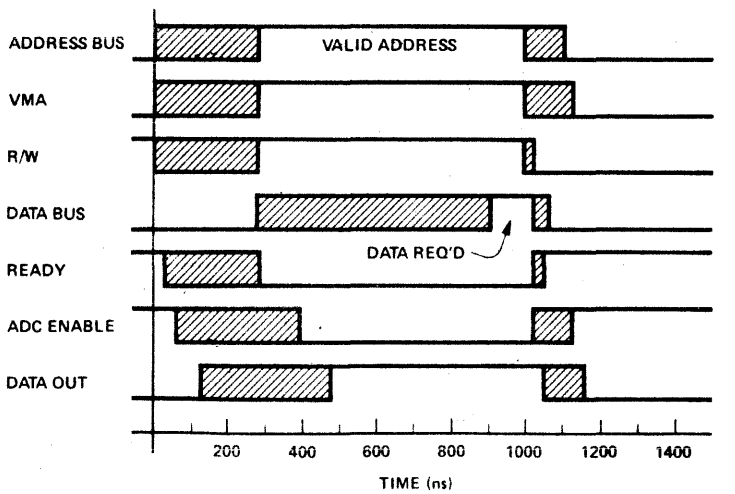

FIGURE 10. Timing and Control for 6800

©IC MASTER 1979

PACE Interface

Figure 11 shows the logic section of the DAU of Figure 7 modified to interface with a PACE μC. The PACE timing is shown in Figure 12. Since the PACE μC has but a single address/data bus, address latches are required for address decoding. The DM8131 address comparator contains output latches, but the DM74L154A 4:16 decoder does not, so a quad latch is inserted ahead of the 4:16 decoder. The latches all set on the rising edge of the NADS signal provided by PACE during the time that address information is on the bus, and drop out on the next NADS signal. Comparator output applied to gate the 4:16 decoder provides an enable ADC signal lasting until the falling edge of the next NADS pulse. The IDS signal ANDed with the comparator output enables the TRI-STATE output buffers and inhibits the clock. An additional MSB inverter would be needed for ± analog signals in order to provide the 2s complement code. Total address decode, control, clock, and output drive circuitry is contained in seven DIP packages, one more than required for the 8080 system interface. Total power and cost are comparable to those given for the 8080 system interface.

ADC CHARACTERISTICS

The ADC for use on a parallel-conversion DAU must contain TRI-STATE output data latches. Otherwise it may be conventional. The MM5357 was designed for direct connection to a data bus, therefore it contains the necessary output latches. At this writing there are other ADCs with the TRI-STATE output latches appearing on the market, and more can be expected. The MM5357 is nearly ideal for use in an 8-bit parallel-conversion DAU. It would be even more suitable to this use if it were a tracking converter, and the polarity of its enable input and of its data output were of opposite polarity. The data polarity is of lesser importance as the bus drivers probably needed may as well be inverting as non-inverting except for common usage. The enable polarity should match the decoder output to obviate the need for 16 inverters (3 logic packages, though of little cost). See the later discussion of ADC hardware for additional thoughts on this subject.

This parallel-conversion data system has data bandwidth limited to about 10 Hz for 8-bit SAR converters, but may be increased to 150-300 Hz with 8-bit tracking

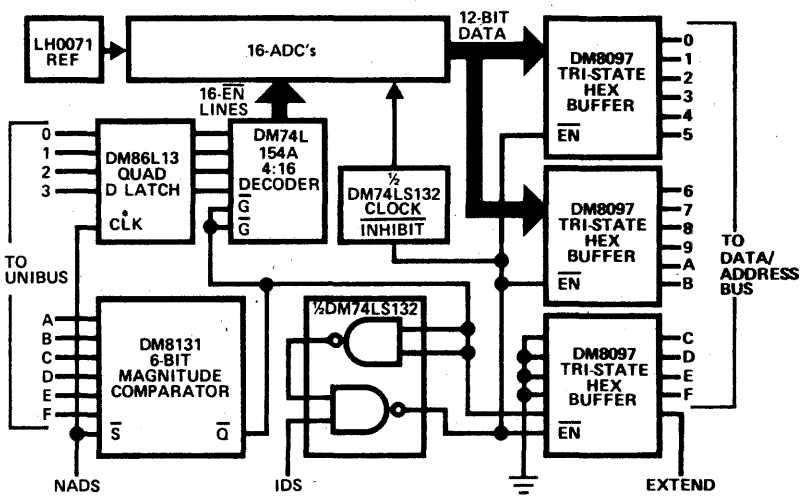

FIGURE 11. 16-Ch, 12-Bit Parallel-Conversion DAU for PACE

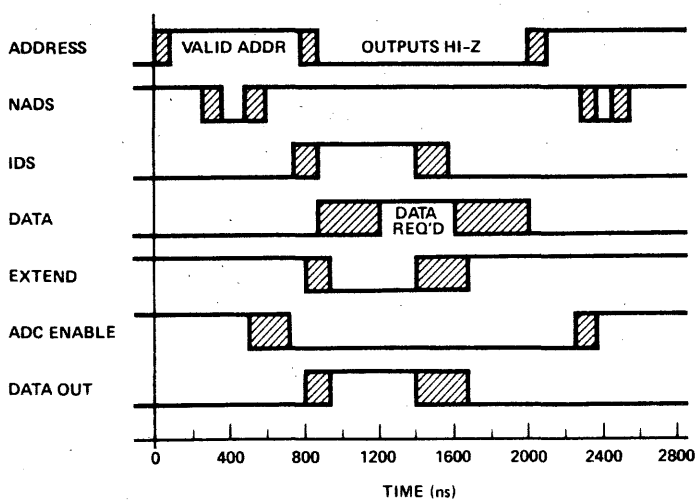

FIGURE 12. Timing and Control for PACE

converters. 12-bit data bandwidth will be 1/16 that of the 8-bit systems. On the other hand, no S&H module is required. Data rates could be considerably increased if S&H modules were added to each channel; however, costs per channel would more than double. For use with S&H modules, SAR logic converters would be faster than tracking types, allowing data bandwidths of over 600 Hz/channel for 12-bit data.

MULTIPLEXED DATA ACQUISITION UNIT WITH MEMORY

A multiplexed data acquisition system containing memory is probably the most cost-effective way of providing an immediate data-access interface to processors. The processor may address the peripheral data-acquisition unit to obtain immediate data without entering a wait mode, just as if it were accessing main memory. Latest valid data is always present within the DAU memory which is updated at a rate determined by the channel multiplexer rate and ADC conversion speed. There is no need to write subroutines into processor software or firmware to address and request data from the peripheral, resume its assigned processing task while watching for a flag set by the peripheral indicating that data is ready, and returning to accept data from the peripheral.

The multiplexed DAU with memory shown in Figure 3 takes care of routinely updating its memory by sequentially sampling each data channel, digitizing the channel signals, and writing data into its self-contained memory. When the DAU is interrogated, the sequential process is momentarily interrupted, the RAMs are addressed by the processor, and data is read out to the data bus. The memory can be three each DM8599 16x4-bit RAMs. These have TRI-STATE outputs, so can connect directly to the data bus. Note that the RAM inverts the data bits from the ADC. The RAMs are available in low-power TTL to drive a lightly loaded data bus, or they are available in Schottky versions for driving higher speed systems. In fact, almost the entire logic system could be realized in Schottky circuits, which should allow interfacing even the new fast bipolar μCs without a wait cycle.

The MUX sequencing circuits are shown in Figure 13. When the μC is not accessing memory on the DAU, the 16 data channels are scanned in continuous sequence.

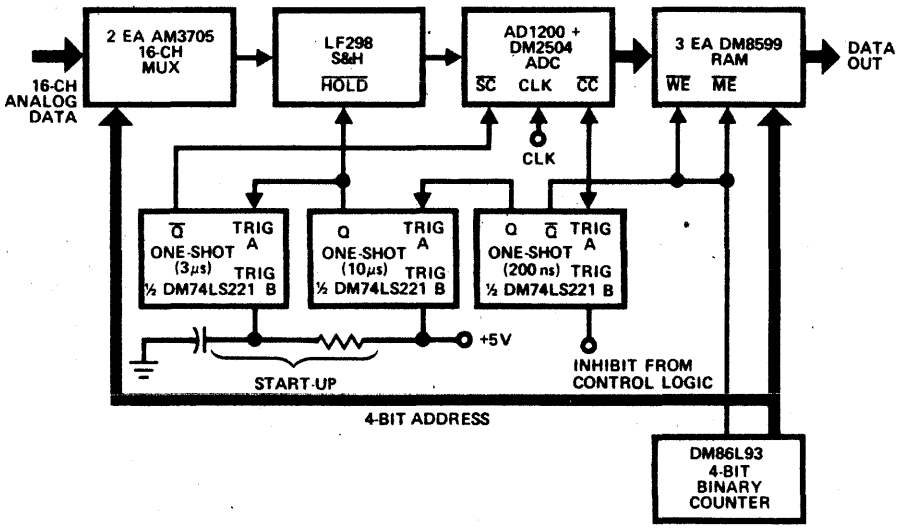

FIGURE 13. Sequencing Logic with OS

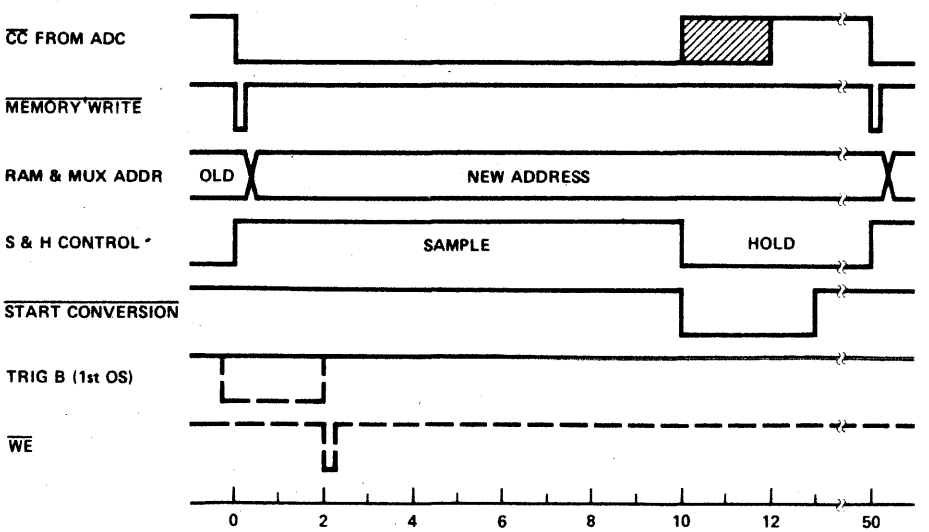

FIGURE 14. Timing for One-Shot Sequencing

©IC MASTER 1979

Data on each channel is sampled and held in the S&H module while the ADC converts the analog data to digital. At the completion of conversion, the digital output of the ADC is written into the RAMs before the multiplexer selects the next channel. The timing and sequencing of channels is accomplished with a 4-bit binary (÷ 16) counter and three one-shot pulse generators. Where one-shots are undesirable, an alternate approach using shift register timing could provide the same function. A valid address output from the address comparator switches the RAM address input from the ÷16 counter to the address bus input, thereby addressing the RAM to the desired channel for data readout. If the data conversion sequence is in the memory write condition, the gate applied to WE prevents switching the MUX to the address bus or returning an XACK signal until the memory has been loaded. Thereupon, the sequence is interrupted as outlined above. The interruption of the sequence lasts for about 1300ns (8080 system) while the address is valid.

The sequential data conversion cycle is shown in the timing signals of Figure 14. The conversion-complete $\overline{CC}$ output of the ADC triggers a one-shot to generate a 200ns memory write pulse. The trailing edge of this pulse advances the address ÷ 16 counter to the next channel and triggers a second one-shot to produce a 10μs sample period. At the completion of the sample period, the S&H goes into hold mode and a third one-shot generates a 3μs start conversion $\overline{SC}$ pulse. When the DAU is in the command read mode, a 0 appears at B trigger input to the first one-shot. If a $\overline{CC}$ signal occurs during the time the 0 is present on the B input, the one-shot will not be triggered until the B input returns to a 1.

An alternate sequencing circuit without one-shot circuits is shown in Figure 15 with timing relationships in Figure 16. It makes use of a shift register and exclusive-OR gates to generate the gates needed to write into memory, sample and hold, and start conversion. The ADC clock is generated at twice the desired clock frequency and divided by 2 in a D flip-flop. In this manner, the minimum gate width is 1/4 of the ADC clock period (620ns in this example). The $\overline{CC}$ signal is clocked into a D flip-flop with a delay of 620ns. The delayed output clears the shift register (SR) and is clocked into the SR after an additional 620ns delay. An exclusive-OR of the SR input and Q1 output generates a 620ns gate to write data into the RAMs. The trailing edge of this $\overline{WE}$ gate clocks the ÷ 16 counter to advance the MUX and RAM address to the next channel. Exclusive-ORing of SR Q1 and Q7 produces an 8.75μs sample gate. (If the acquisition and settling time of the S&H is greater than 8.75μs, additional circuit complexity is required.) Exclusive-ORing of Q7 and Q8 produces a synchronized 1.25μs gate to start the ADC. This circuit may not be the most versatile or elegant for the purpose. For those applications with longer S&H acquisition times or other requirements, some alternate circuit may be designed if that of Figure 15 is unacceptable.

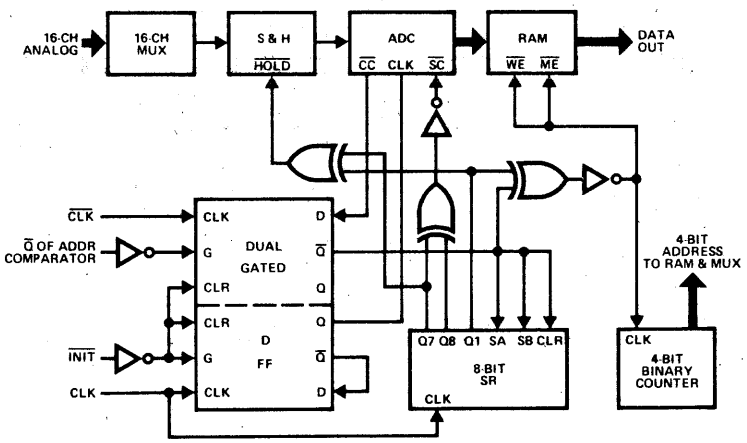

FIGURE 15. Sequencing Logic with SR

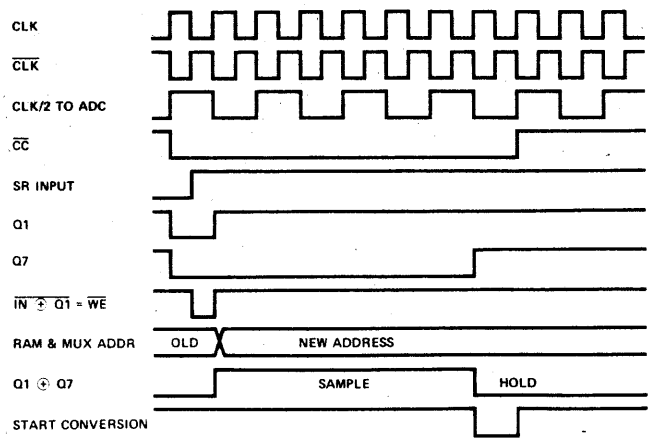

FIGURE 16. Timing for S-R Sequencing

The μ-computer interfaces shown in Figures 17 and 18 are similar to that of Figure 5. The PACE interface is seen to be slightly less complex than that of Figure 17 for 8-bit data-bus machines. A single DAU card with plug-in or strap options could be built to interface any of the three μCs considered. Such a universal circuit is shown in Figure 19. This circuit also includes an option to provide binary output for unipolar analog signals or complementary binary output for ± signals. In the case of binary output, the 13-16th data bits are set to 0. In the case of complementary binary, the sign bit is extended to the 13-16th data bits for valid recognition by the μC.

The total dissipation is 3.5 watts and cost is $11 per channel as shown in Table 5. Both are only slightly greater than those for the conventional DAU.

The ADC desired for this application is similar to the conventional ADC except that the ADC data output should be complementary to compensate for the data inversion within the RAMs. The AD1210 or AD1200 are thus ideal choices for an ADC in the multiplexed DAU with memory.

CONVERTER CHARACTERISTICS

Each approach to the DAU requires different characteristics of the ADC. Table 6 summarizes the requirements for each of the three DAU types. The sequential or addressed DAU types require similar ADCs. If the conventional addressed DAU must utilize bus drivers, the desired ADC characteristics are identical to those for the sequential DAU with memory. Only the parallel-conversion DAU is seen to require buffered TRI-STATE output latches.

By far the most important characteristic of an ADC for use in a parallel-conversion DAU is that it have buffered TRI-STATE output latches. It is desirable that it also have the other characteristics checked in Table 6. Items 1 and 2 are by far the most important of the desired characteristics. The need for item 1 has been discussed. TTL compatible control and data signals are desirable so that TTL-MOS and MOS-TTL interface buffers are not required between the ADC and the rest of the system. Dual output strobing makes it possible to wire-OR interface directly to an 8-bit data bus or to use only an 8-line buffer without the need for the output multi-

plexers shown in Figure 5 et. al., although a separate buffer is required in most systems. Tracking operation provides the higher speed useful in a conversion circuit without an S&H. Inhibiting data transfer to output data latches when the output is enabled prevents changing the output code while data is being read from the data bus. This function can be accomplished with an external gate, but could be convenient if handled within the ADC logic. Straight binary (not complemented) output is desired for all μC interfaces (except the 8080 when operating with Intel system bus drivers and receivers). As it may be necessary to add TRI-STATE line drivers to drive the data bus, data inversion can be handled by inverting buffers when required. The availability of both Q and $\overline{Q}$ outputs on the MSB simplifies data readout as binary or 2s complement without adding an external inverter. Table 6 has been arranged in the approximate order of preference for parallel-conversion DAU use; the preference will be different for multiplexed data.

The National MM5357 is the choice for an 8-bit ADC having buffered TRI-STATE output latches and TTL compatibility when converting ±5 or 0-5V analog inputs. If converting 0-10V inputs, it becomes 10V CMOS compatible. Several monolithic ADCs of 8 to 12 bits have been announced. These monolithic converters and future versions of them promise to bring converter prices down to a level which will make parallel-conversion economically feasible. Several hybrid converters have also been announced with attractive prices; however, it is the monolithics which promise the lowest ultimate cost. Features of several of these new products are compared in Table 7. Although only the MM5357 and the AD7550 are suitable in present form, their prices and characteristics show that the desired attributes are and will be possible at the needed prices.

The future ADC most suited for use in a parallel-conversion DAU might appear as in Figure 20. This

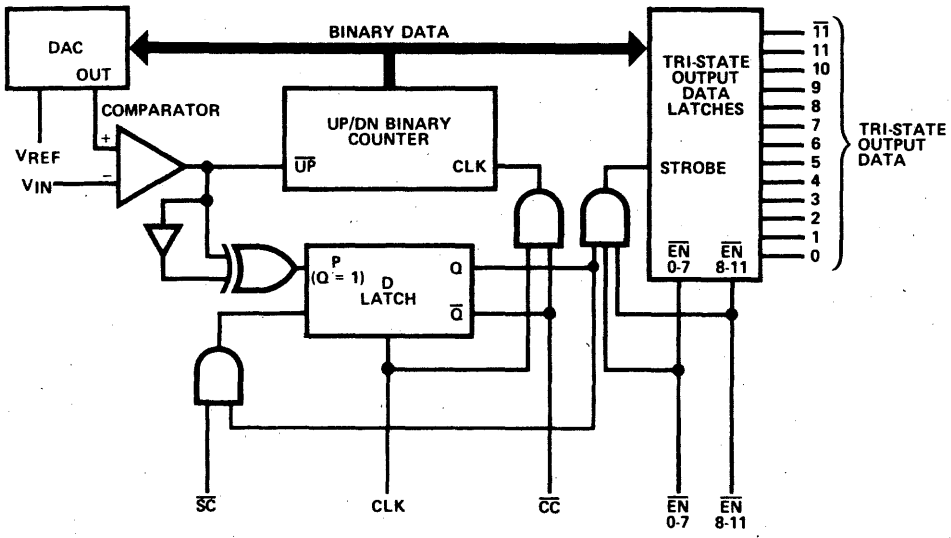

FIGURE 20. Tracking ADC for Parallel-Conversion DAU

design meets all the goals of Table 6. It could run at a clock rate of 0.25-1MHz (1-4μs conversion time) because it is a tracking converter, it contains TRI-STATE buffered output data latches, the separate high and low bit-enable lines allow two-byte operation of an 8-bit data bus, the output latches will not change state when the output is enabled, and the $\overline{CC}$ and $\overline{SC}$ terminals may be strapped for continuous conversion without missing a clock period. An 8- or 10-bit converter and possibly a 12-bit converter of this type could be built on a single chip without much difficulty. If not, a hybrid or two-chip design is practical. Where speed is not of importance, monolithic 10- or 12-bit converters can be built with integrating or voltage-to-frequency conversion techniques. The integrating technique possibly allows the greatest accuracy with the least circuitry, and is a prime contender for the application. As the integrating ADC utilizes both linear and digital circuits, it is normally of multi-chip design. However, as technology advances, it will become increasingly practical to produce the low-drift, low-offset amplifiers, integrators, and current sources required of a 12-bit ADC on a single reasonably small chip along with the necessary logic. A two-chip approach would likely be the choice today. We will certainly see some of these desired design features appearing on ADCs in the near future.

As far as ADCs and DACs are concerned, the entire makeup of their internal logic sections is different from that of conventional converters of today (except for the MM5357 and AD7550). Tables 6 and 8 outline the desired characteristics of ADCs and DACs for parallel-conversion and multiplexed systems. Figures 20 and 21 indicate the logic required. The ADC of Figure 20 is suitable for relatively high speed data acquisition without S&H circuits, while that of Figure 21 is suitable for slowly varying data only.

DATA DISTRIBUTION SYSTEMS

Until now, the discussion has centered entirely around the data acquisition end of the system. At first thought, the data distribution may seem almost trivial. However, there is still the address recognition and decoding plus the control functions. The conventional data distribution unit (DDU) has used a single DAC, a multi-channel analog demultiplexer, low-pass filters and possibly S&H

Table 8. Desired D/A Converter Characteristics

	Parallel Conversion	Multiplexed System

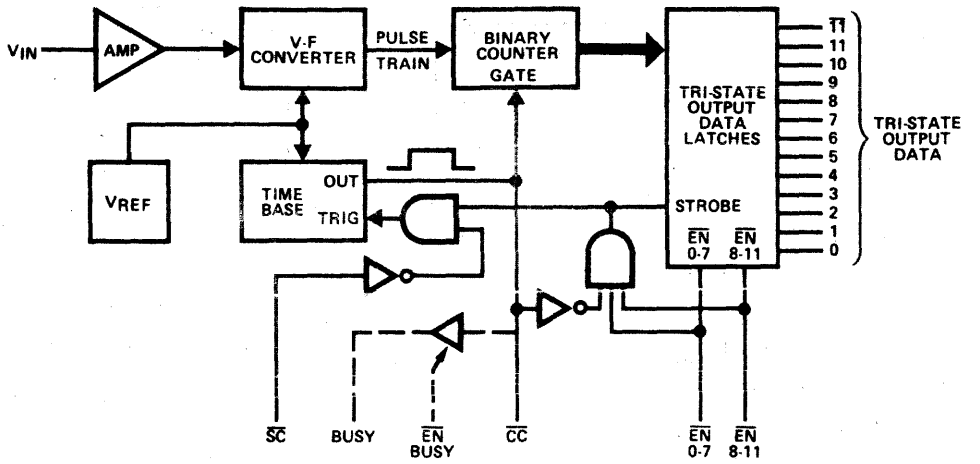

FIGURE 21. V-F ADC for Parallel-Conversion DAU

circuits on each channel reconverted to analog form. Such a system could benefit from a DAC with input data latches and separate (double-byte) input gating or strobing controls while a parallel-conversion DDU has even more need of these input characteristics.

The parallel-conversion DDU shown in Figure 22 would, if constructed with available DACs, require 12-bit input data latches ahead of each DAC. The characteristics desired of a DAC for this use are listed in Table 8. High impedance digital inputs prevent loading the data bus while a strobed input data latch allows entering data only in the addressed DAC and holding it until updated (thus performing the function of DAC and S&H). Separate input data strobes for low and high bits are used for the same reason as with the ADC, for alternate enabling on successive input data bytes. Figure 23 outlines the desired DAC for use in a parallel-conversion DDU.

The DDU address decoding and complexity is similar to that of the DAU. Input data strobing separated as 8 LSB and the remaining MSB is an advantage when used on 8-bit data bus systems. The cost per channel is essentially that of the DAC used. Likewise, for power dissipation. Practicality will be entirely dependent on ultimate cost of the converters. Advantages over a demultiplexed system are that only minimal output filters are required and that an output amplifier per channel is not required (already exists in each DAC).

CONCLUSION

Each type of DAU described exhibits unique advantages as indicated in the comparisons of Table 9.

Further reduction in the costs of monolithic converters will make the parallel-conversion type of DAU attractive where low-speed data is handled. For 8-bit data, this type of DAU is extremely attractive at this time because the DAU cost per channel is essentially that of an ADC which is as low as $8 in lots of 100.

It would seem that the multiplexed DAU with memory exhibits all of the advantages of the conventional random-addressed DAU plus all those of the parallel data conversion DAU except that the data in any specific channel may be older. Offsetting this single comparative disadvantage are significantly lower cost per channel, lower power requirements, and no requirement for special ADCs with buffered output latches. The multiplexed approach with memory is only slightly more complex or costly than a standard DAU, yet it brings the great advantage of high-speed immediate data access with significant cost savings over the parallel conversion technique.

Although the character of an ADC or DAC used in a parallel-conversion data system differs markedly from those used in the usual multiplexed data system, the processor interface requirements are similar or identical. The sense of μC bus control signals is of relatively minor importance so long as they are standardized among the several μC units available. Positive-true data and address signals are possibly a slight advantage over zero-true signals when TRI-STATE circuits are used. For the multiplexed system described, data inversion through the RAM would suggest the advantage of complementary binary output data from an ADC.

Conventional ADCs and DACs available today (except the MM5357 and AD7550) do not have the characteristics needed for parallel-conversion systems. However, this picture is changing as more units are designed for direct data bus interface. Fortunately, however, the multiplexed DAU with memory does not require the bus oriented type of ADC. There is at least one available DAC which includes the dual-strobed input data latches suggested for direct data bus interface; I would expect to see others appearing in future designs, both monolithic and hybrid.

A Low Component Count Video Data Terminal Using the DP8350 CRT Controller and the INS8080 CPU

National Semiconductor
Application Note 199
Al Brilliott
August 1978

INTRODUCTION

The DP8350 is an I^2L – LS technology integrated circuit, designed to provide all control signals for a cathode ray tube (CRT) display system. This application note explains a system using the DP8350 and the INS8080 microprocessor. The design philosophy shows how the DP8350 interfaces to the INS8080, completing the function of a video data terminal with a minimum component count. After reading and understanding this application note the reader will realize the ease and flexibility of designing video terminals with the DP8350*. To thoroughly understand this application note the reader must be familiar with the DP8350 and the INS8080 microprocessor.

The video data terminal described is divided into the following sections, *(Figure 1).*

The DP8350 CRT controller (CRTC).

The 8080 μP system which includes ROM, RAM, interrupt instruction port, oscillator, and control support chips.

The character generator.

The communication element.

The keyboard and baud rate select ports.

THE CRTC

The DP8350 generates all the required control and timing signals for displaying video information on the video monitor. Here is a summary of the controller's functions:

Dot clock, control, and counter outputs for the character generator.

Bidirectional RAM address refresh counter for refreshing the video RAM and allowing microprocessor loading to the internal DP8350 registers.

Direct drive horizontal and vertical sync signal outputs.

Direct cursor address location output. The cursor is internally delayed or pipelined, allowing for the access time of video RAM and the character generator ROM, *(Figure 1).*

THE CPU

The microprocessor provides CRTC, operator, and external machine control for the system. When the CRT controller is not actively refreshing the video RAM, (i.e., during vertical retrace or blank scan lines), the microprocessor is enabled for system housekeeping, *(Figure 2).* This method of multiplexing the RAM with the CPU and the CRTC eliminates the need for line buffers.

*The DP8350 is equivalent to the INS8276

THE CHARACTER GENERATOR

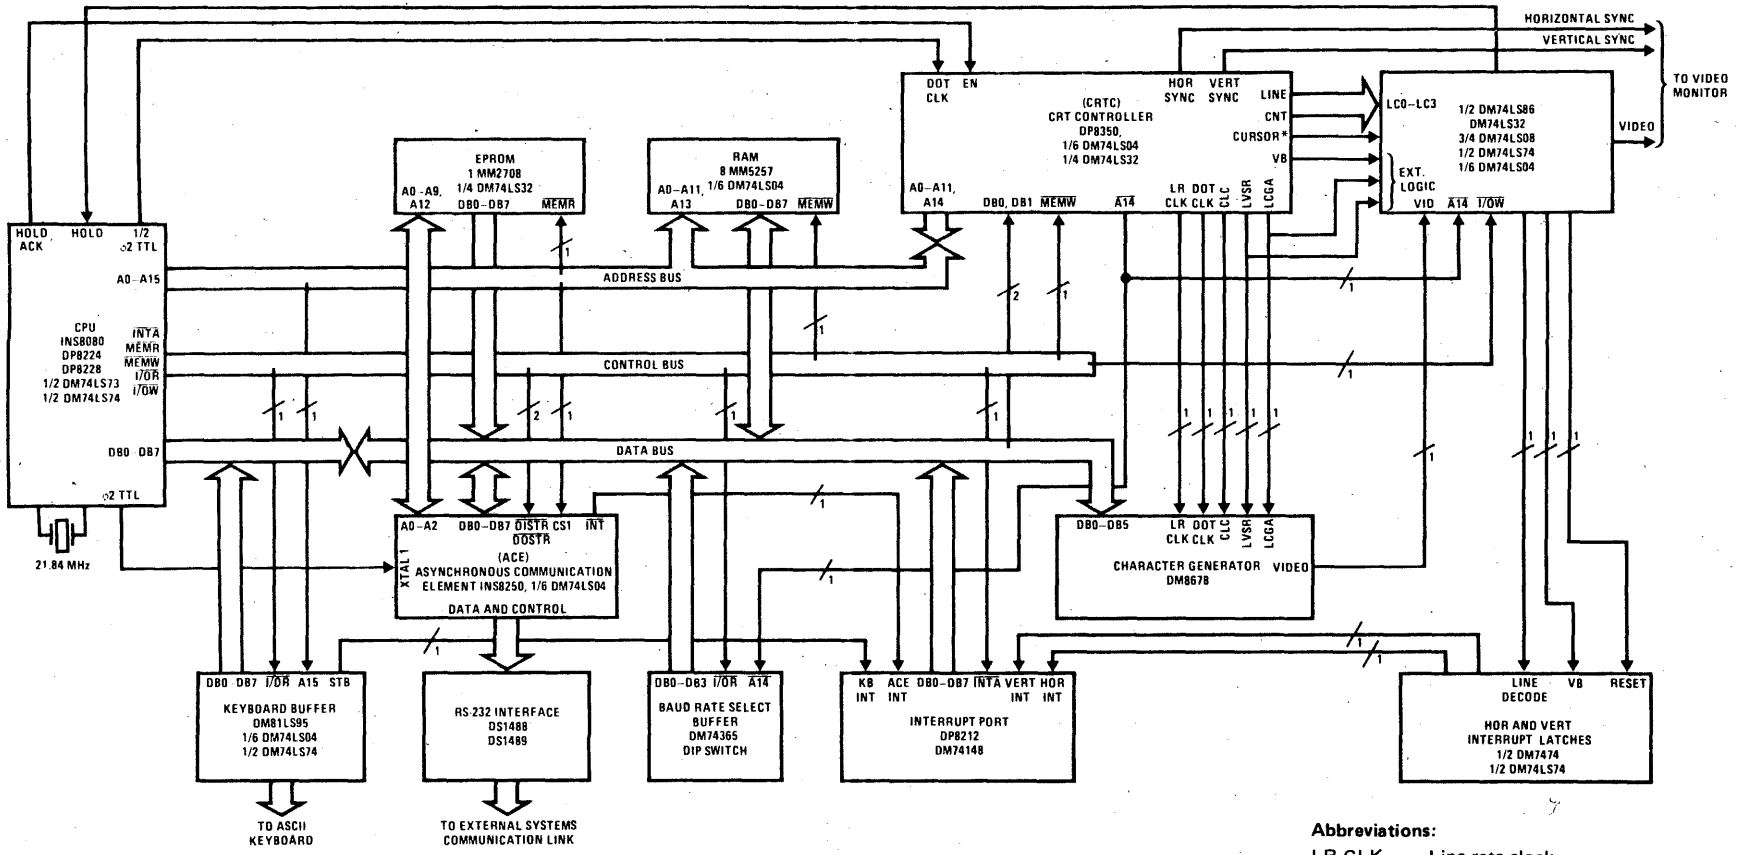
The character generator consists of 3 elements: an address latch to hold the input address to the character ROM allowing for the access time of the ROM; the character ROM that stores the ASCII character in a form for parallel to serial conversion by the shift register; the shift register converts the character ROMs parallel output to serial form. The serial output from the shift register is the true video output, modulating the video monitors electron beam which writes characters on the screen. All of the 3 elements of the character generator are combined in the DM8678, *(Figure 3).* The DP8350 CRTC provides all the control signals for the DM8678.

THE COMMUNICATION ELEMENT

The INS8250 is the asynchronous communication element (ACE) for the data terminal. The ACE allows the CPU portion of the data terminal communication with peripherals or host computers at the correct baud rate, *(Figure 1).* The ACE is programmed by the CPU to send and receive serial data at the standard baud rates from 110 to 4800 baud. The ACE, in conjunction with the DS1488 and DS1489 line drivers and receivers, also provides full RS232C synchronous communication if higher baud rates are desired. System communication speed must always be considered to insure the baud rate does not exceed the time required for the CPU to process a data byte. Asynchronous communication at baud rates higher than 4800 are possible by adding a line buffer.

SYSTEM INITIALIZATION

Application of the terminal's power supply resets the microprocessor, the communication element, and the CRT controller. Resetting the ACE is necessary to clear the interrupt. Resetting the CRTC is not absolutely necessary since the microprocessor loads the cursor and top of page registers in the initialization routine.



Following the reset all interrupts are disabled to avoid unwanted interrupts from the CRTC, ACE, or I/O ports. Refer to the initialization routine in the flowchart.

The stack pointer is loaded to the bottom of scratch pad RAM (3FFFH) for use as the register save pointer, *(Figure 4).*

The entire RAM is written with ASCII spaces generating a cleared screen. After completion of the screen clear loop the CPU writes 000H to the cursor and the top of page registers in the DP8350 CRTC. The routine homes the cursor to the upper left corner of the screen. The top of page register was loaded with 000H, therefore, the video RAM is refreshed by the CRTC from that starting address to the last address on the screen of video RAM (1920 characters).

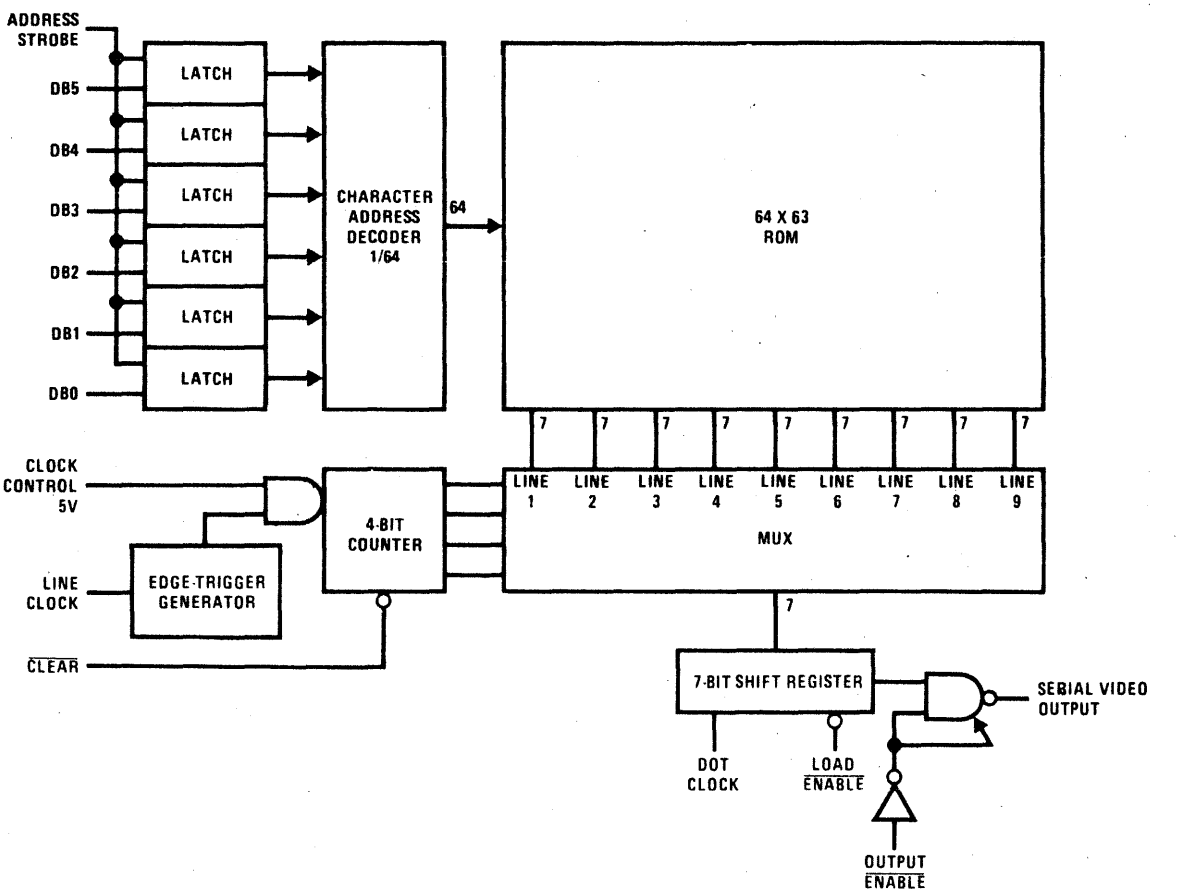

FIGURE 3. DM8678 Character Generator Block Diagram

©IC MASTER 1979

The CPU is ready to perform the communication element (ACE) load routine. First, the baud rate divisor for the ACE must be determined. The baud rate select switch is read providing a code which corresponds to the appropriate 16-bit divisor for the ACE. This divisor determines the baud rate at which the ACE will communicate. Any additional programming requirements needed for the ACE to communicate with host computer systems could also be done at this time. The software in this system does not contain any additional programming for the ACE. There are many programming modes related to the ACE. Details of these modes are beyond the scope of this application note.

The row start look-up table, *(Figure 5)*, is loaded up by a simple algorithm that loads and adds the data for referencing a row number to that row's starting address. The reference table, *(Figure 6)*, is initialized next by direct loading. This table provides the CPU with top of page, bottom of page, next row load, cursor row, and scratch row numbers for system housekeeping.

Finally, the new row start and vertical interrupt latches are cleared, *(Figure 7)*. The register pointers are loaded and the CPU is forced in a wait loop with interrupts enabled.

NON-SEQUENTIAL ADDRESSING

The data terminal described here was designed for non-sequential starting row addressing. In many systems sequential row addressing is used. If a character row consists of 10 scan lines the RAM is addressed 10 repetitive times from 000H through 04FH, *(Figure 2)*. The next row is refreshed in the same manner from 050H to 09FH. The starting row address is sequential 000H, 050H, 0A0H–EB0H for row numbers 0H, 1H, 2H,–2FH, respectively. Non-sequential row addressing would be equivalent to 050H, 000H, 0A0H–EB0H for row numbers 1H, 0H,–2FH, respectively, *(Figure 4)*.

In conjunction with the CPU, non-sequential row addressing is quite easily accomplished with the DP8350 since this is one of the features designed into the part. Accomplishing this task basically requires the following sequence of events. Assume the CRTC has finished writing a video row in the middle of the monitor's screen. This system has a 5 x 7 character font in a 7 x 10 field, *(Figure 2)*. At the completion of the last video scan line 7 the CRTC line counters continue to count the last 3 lines. Video is not present since the character is only 7 scan lines high. The blank scan lines are 7, 8, and 9 permitting the CRTC address outputs to be TRI-STATED®, allowing the CPU to run. When the line counter outputs increment to scan line 8 an interrupt signals the CPU. The interrupt occurring is the new row start interrupt. The interrupt routine fetches the next CRTC row number from the reference table *(Figure 6)*. This number is converted to the new starting row address, explained later, and loaded to the CRTC row start register. The CPU finishes the routine by clearing the interrupt, readying itself for the next new row start interrupt. The entire routine takes 1 scan line of time, approximately 64 μs. The CRTC continues to scan the video RAM from that new starting address on for the next 7 repetitive scan lines of the next row. Many advantages become apparent using the non-sequential addressing scheme. Scrolling up or down with the cursor always on the screen may be done faster and easier from a hardware/software standpoint. Exchanging one row with another row is fast since it is not necessary to rewrite the video RAM. Row swapping is useful for higher end terminals requiring row editing functions.

FIGURE 9. Example From the New Row Start Look Up Table

©IC MASTER 1979

ROW LOADING DETAILS

Obtaining the next starting row address for the CRT controller is accomplished by an addressing and adding scheme from the new row start look-up table. The same scheme is used to determine any needed address, given the row number.

Figure 9 shows a row number and address taken from the new row start look-up table.

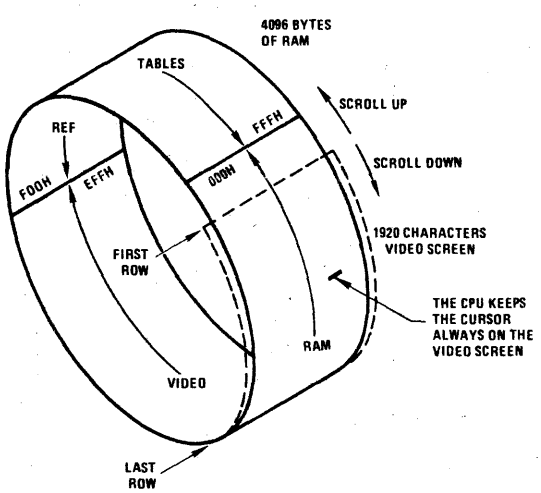
The row number is loaded from the reference table in RAM to a register. The CPU determines the starting address from the row number and stores it in a 16-bit pointer register. The higher order 4 bits contain address for the RAM or the CRT controller, *(Figure 8)*.

Here are the details of how this is accomplished. Refer to the new row start interrupt in the software listing and *Figure 9.*

The CPU D-E registers are loaded to point to a row number in the reference table. The number is put in the accumulator and moved into the E register. The D-E register in this example now contains 3F20 which points to NRS HIGH ROW DATA (3A). The addressed data is moved to the accumulator and then to the H register. If it was desired to point to the CRTC then 20H would have been added to it first. The D-E register still contains 3F20H. To obtain the NRS LOW ROW DATA the E register is moved to the accumulator and 30H is added to it. Now the D-E register contains 3F50H and points to NRS LOW ROW DATA (00H). The data is loaded to the accumulator and then to the L register. The H-L registers contain 3A00H which is the starting row address for row number 20H. The method just described is used throughout the terminals program to move the cursor, load the top of page, and load the new starting row address in the CRTC.

VERTICAL INTERRUPT

The vertical interrupt occurs when the CRTC has completed refreshing a video page (1920 characters) of information. Vertical blanking identifies that condition and interrupts the CPU forcing it to the vertical interrupt routine. Refer to the vertical interrupt in the flow chart. The routine moves the first row number to the CRTC row number, updating it so the next new row start load occurs with the top of the page address or the first row of the video screen.



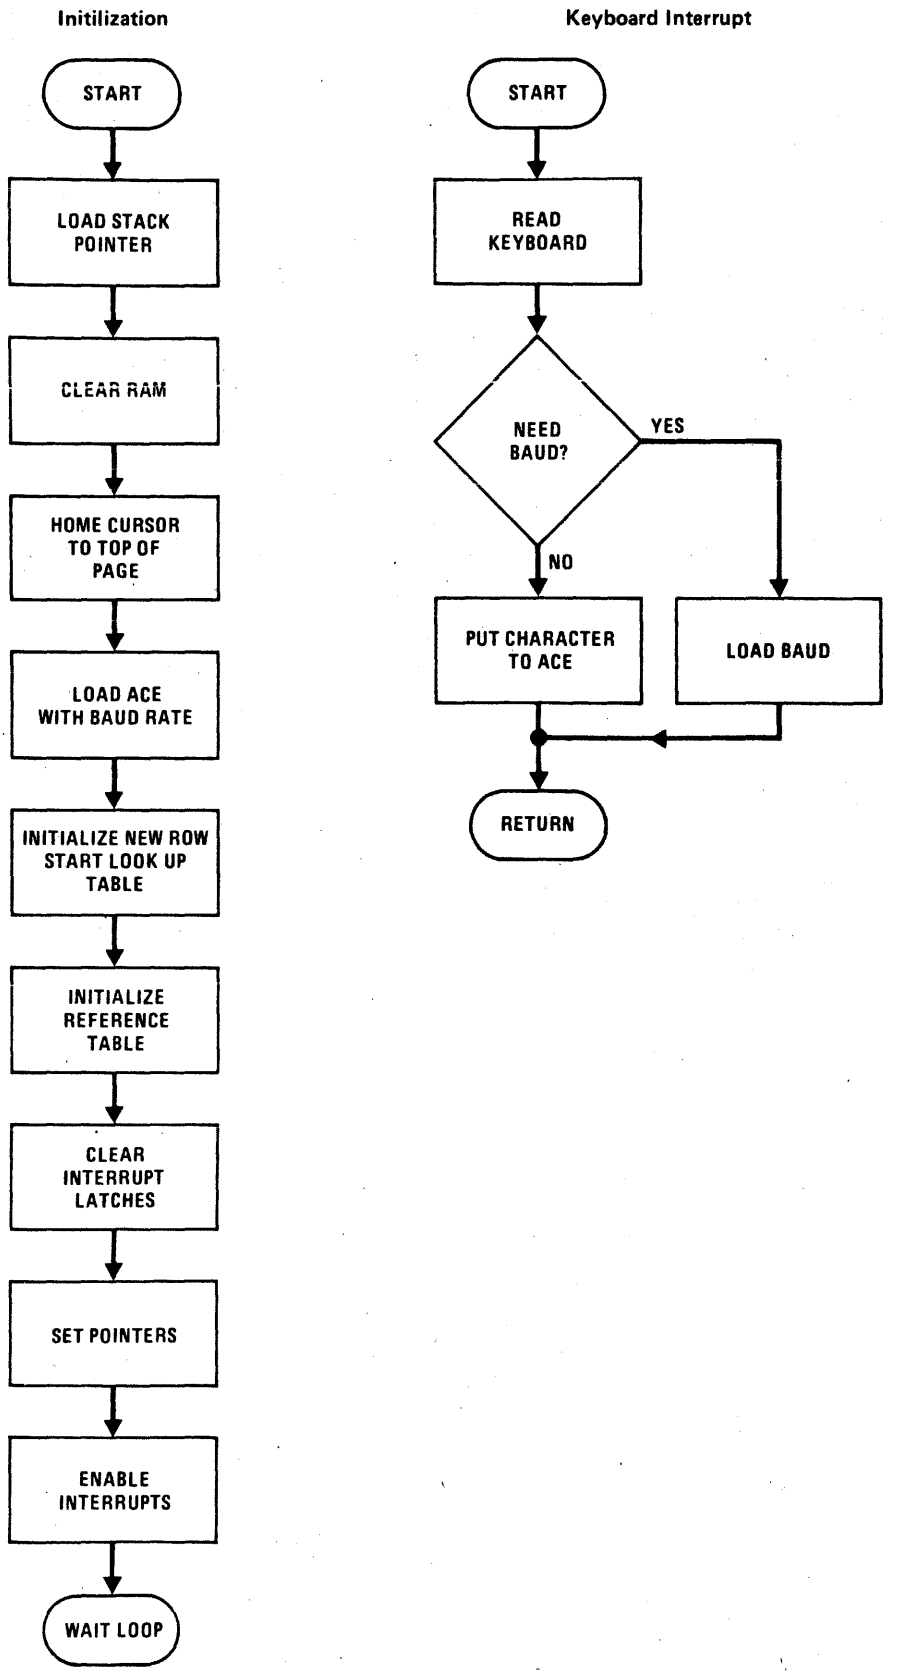
KEYBOARD INTERRUPT

The external keyboard requirements are ASCII outputs with a suitable strobe to interrupt the CPU for keyboard servicing. Refer to the keyboard interrupt in the flow chart. After the keyboard buffer is read the data byte is tested for a (CNTL E), new baud rate command. If the test fails the CPU writes the data byte to the ACE. Passing the test forces the CPU to read the baud switch and load the ACE with the new baud rate.

ACE INTERRUPT

As mentioned above, a data byte read from the keyboard that is not a baud rate command enters the accumulator. The CPU writes the data byte from the accumulator to the transmitter holding register in the ACE. The ACE proceeds to shift out the data byte, with the appropriate start and stop bits, serially from the (SOUT) output. The data is shifted to the serial input (SIN) of the ACE and loaded into the receiver holding register. When the register is full the ACE interrupts the CPU, initializating the ACE service routine. Refer to the ACE interrupt in the flow chart.

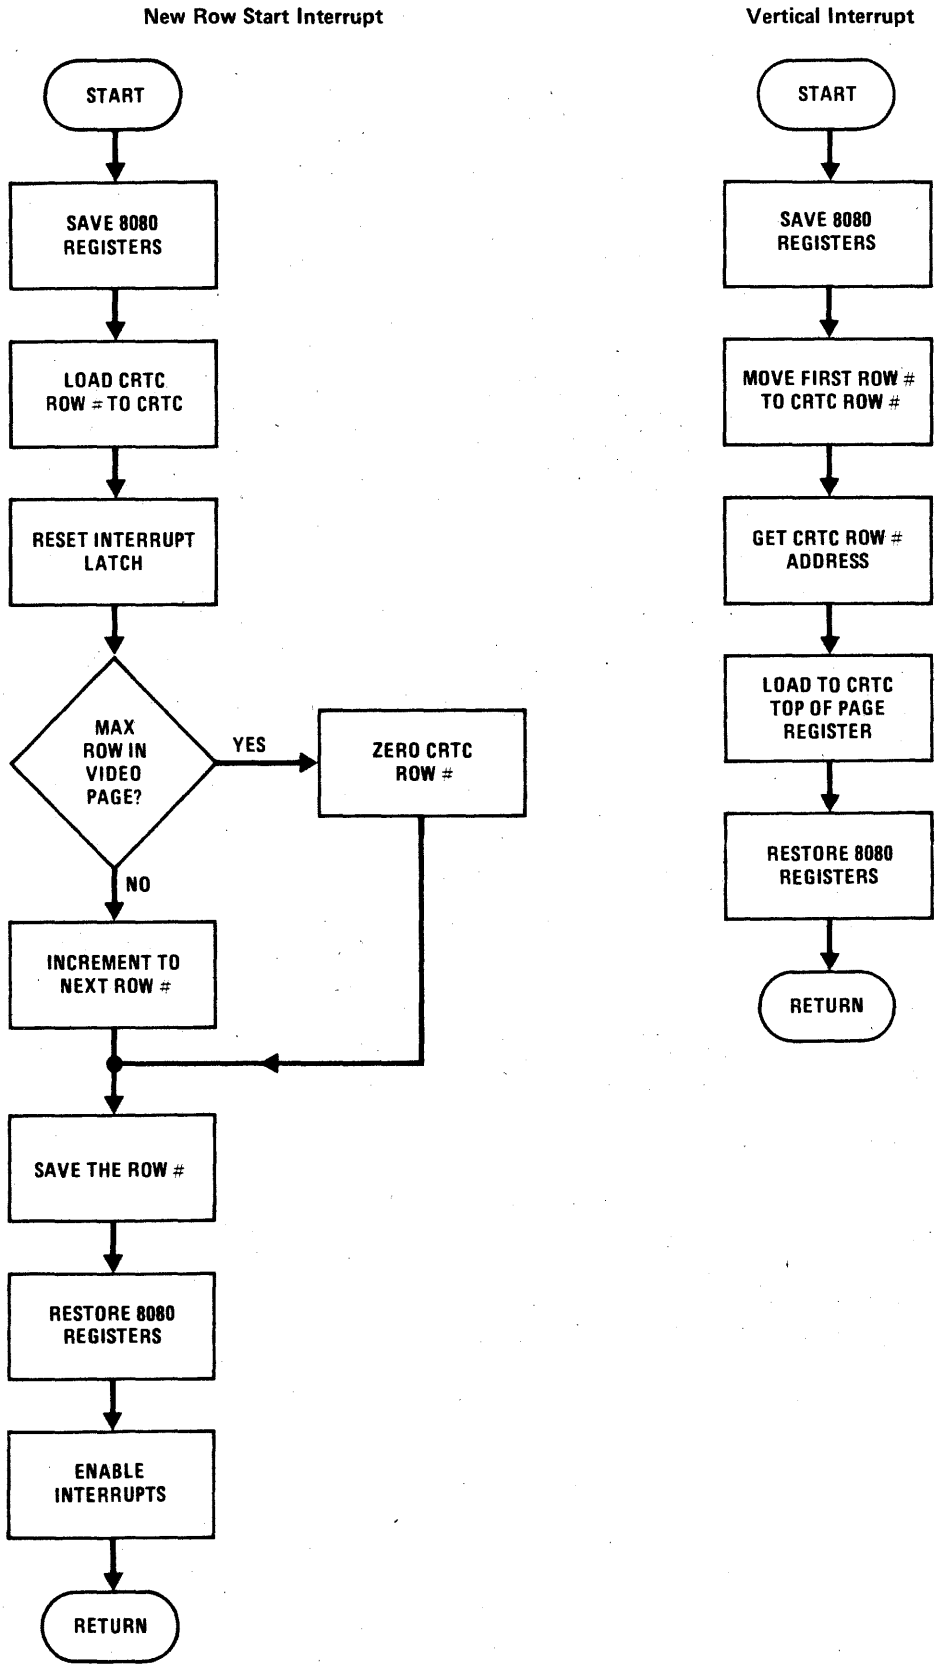
The CPU reads the receiver holding register in the ACE. Reading the ACE resets the interrupt. The data byte now resides in the accumulator. The CPU tests for a control or an escape function. The function is executed if test conditions are met. Refer to the keyboard interrupt routine in the software listing. The data byte is written to the video RAM at the cursor address which appears on the monitor screen. The cursor and character numbers are incremented as long as it is not at the end of a row. A character at the end of a row requires further testing to recognize the following situations. Is it the last row on the monitor's screen? Or is it on the maximum row of the video RAM? Essentially, the cursor is forced to stay visible on the video monitor's screen and video RAM is always kept out of scratch pad RAM, *(Figure 10).*



The video screen is allowed to scroll only through the video RAM (000H to EFFH). The CPU keeps the video screen within these bounds by loading the new row start register with that address range only (row 00H to 2FH).

FIGURE 10. Drum Analogy for the RAM

FULL/HALF DUPLEX OPERATION



The data terminal and a host computer in the full duplex mode of operation would receive the serial information, process it, and send it back to the SIN input of ACE. Using the terminal in a stand-alone mode for testing, the serial out SOUT is tied to the serial in SIN of the ACE. In the half duplex mode a data byte is sent to the host computer at the same time it is sent to the terminal. When the data terminal is set up to communicate with a host computer the full duplex mode of operation is desirable.

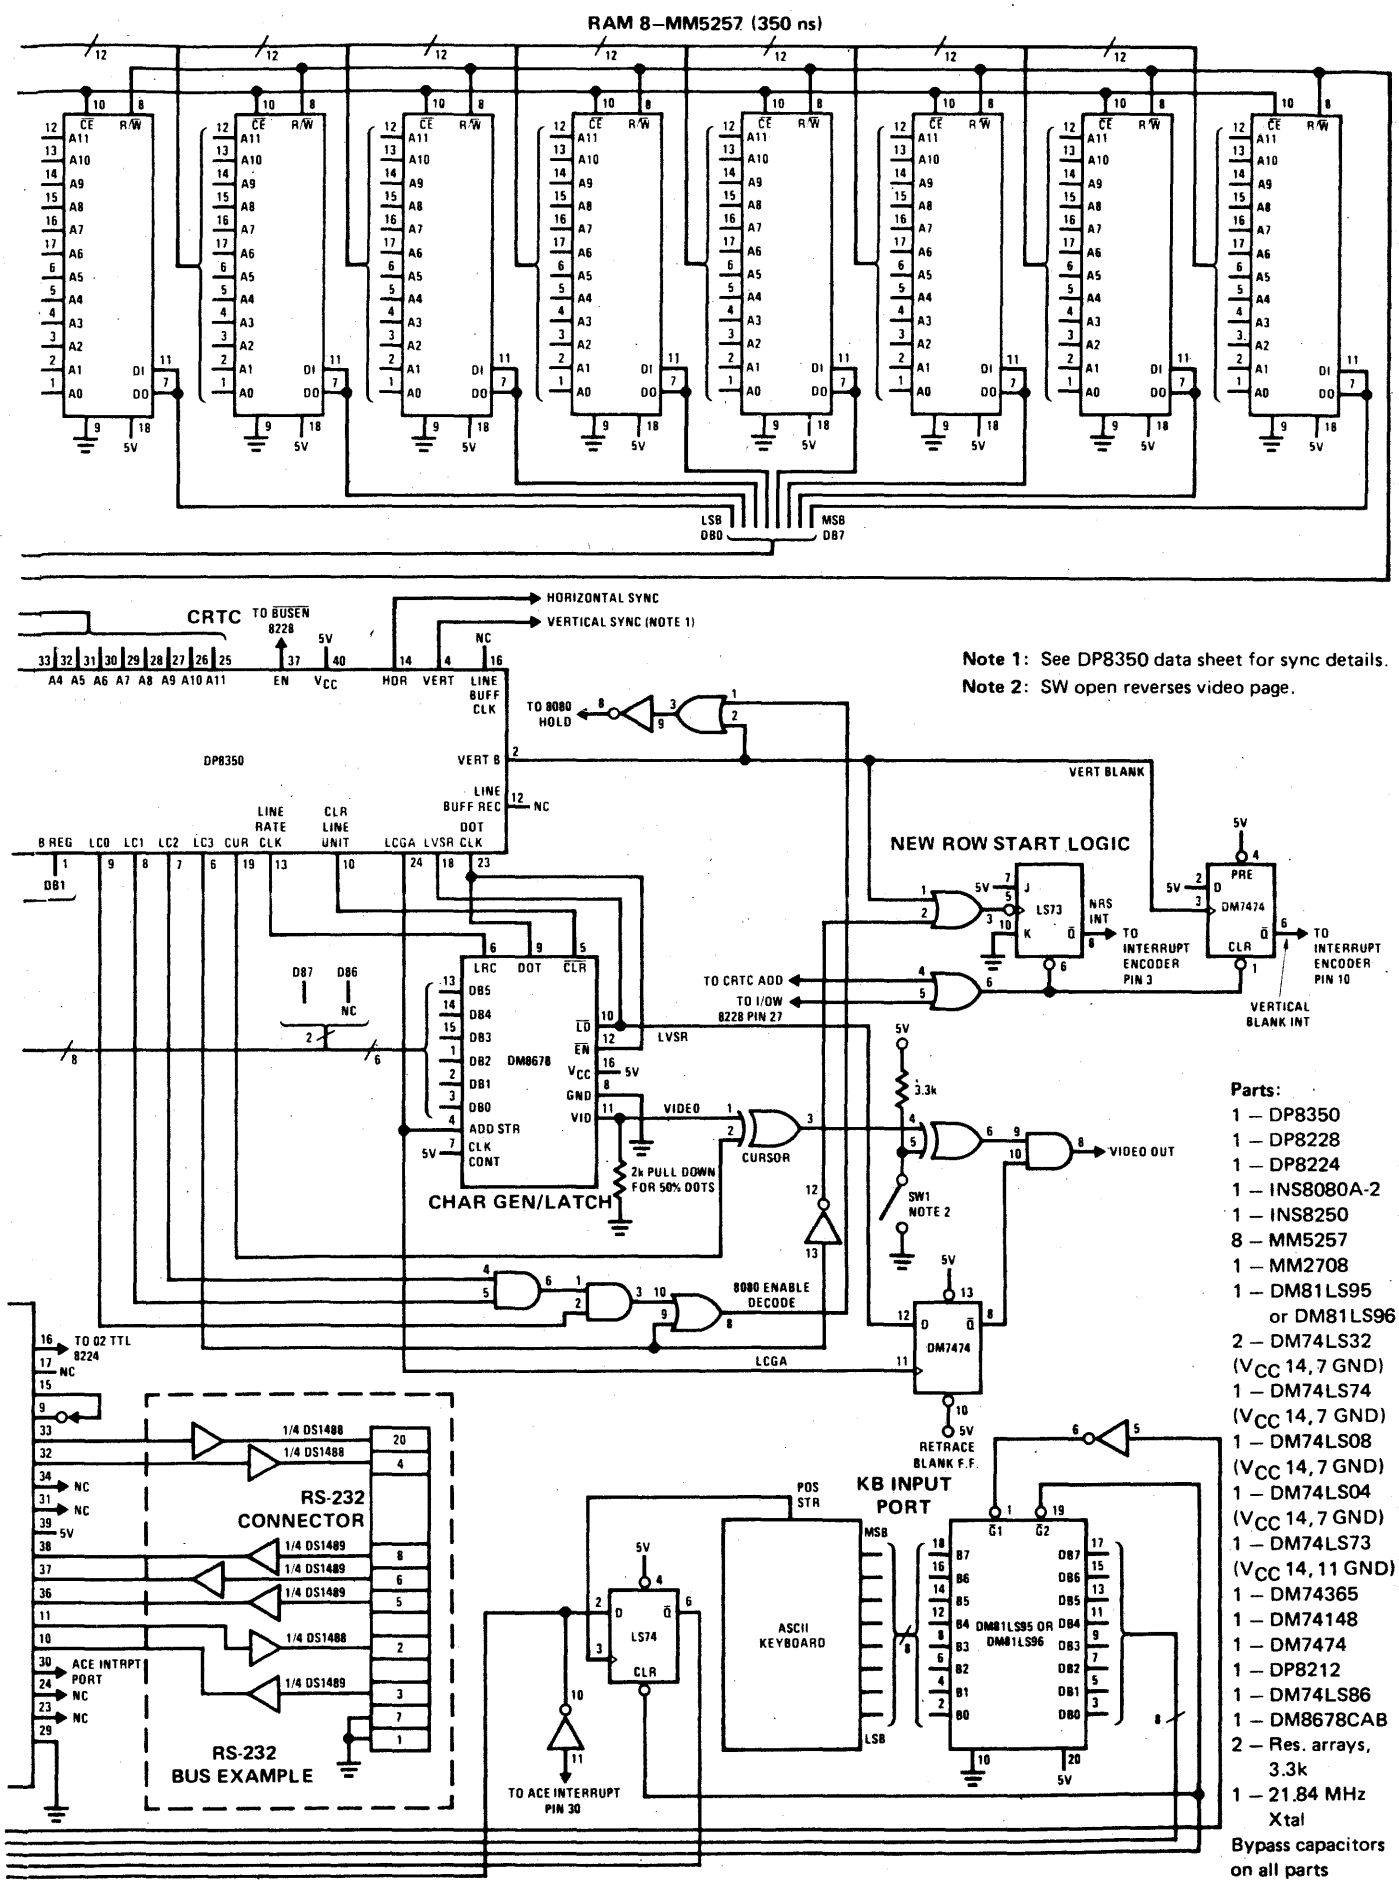
(Continued on page 13)



FEATURES

- Keyboard input port
- Serial I/O up to 9600 baud
  - 4k bytes RAM
  - 1k byte ROM
- 2 video pages
- 80 x 24 characters
- 5x7 character font, 7x10 field size
- Block cursor
- Single crystal
- Maximum CPU time/frame without line buffers
- Line or page scroll capability
- Full cursor control
- Complete software flexibility
- Modem control capability
- Low component count
- Field reverse
- Clear screen, clear row, home and clear
- Row swap (row interchange)

VIDEO DATA TERMINAL SYSTEM SCHEMATIC

©IC MASTER 1979

Note 1: See DP8350 data sheet for sync details.

Note 2: SW open reverses video page.

Parts:

- 1 – DP8350
- 1 – DP8228
- 1 – DP8224
- 1 – INS8080A-2
- 1 – INS8250
- 8 – MM5257
- 1 – MM2708
- 1 – DM81LS95 or DM81LS96
- 2 – DM74LS32 (V_{CC} 14, 7 GND)
- 1 – DM74LS74 (V_{CC} 14, 7 GND)
- 1 – DM74LS08 (V_{CC} 14, 7 GND)
- 1 – DM74LS04 (V_{CC} 14, 7 GND)
- 1 – DM74LS73 (V_{CC} 14, 11 GND)
- 1 – DM74365
- 1 – DM74148
- 1 – DM7474
- 1 – DP8212
- 1 – DM74LS86
- 1 – DM8678CAB
- 2 – Res. arrays, 3.3k
- 1 – 21.84 MHz Xtal

Bypass capacitors on all parts

CMOS A/D Converter Chips Easily Interface to 8080A Microprocessor Systems

National Semiconductor
Application Note 200
Jake Buurma

SUMMARY

This paper describes techniques for interfacing National Semiconductor's new ADC3511 and ADC3711 microprocessor compatible analog-to-digital converter chips to 8080A microprocessor systems. The hardware interface and the software interrupt service routine will be described for single and multiple A/D converter data acquisition systems.

INTRODUCTION

The recent introduction of monolithic digital voltmeter chips has encouraged designers to consider their use as analog-to-digital converters in data acquisition systems. While the high accuracy afforded at low cost was attractive, certain difficulties in applying these devices in digital systems were encountered. Most of these difficulties were due to the DVM chip's output structure being oriented towards driving 7-segment displays with internally generated digit scanning rates. National Semiconductor has recently introduced a family of monolithic CMOS A/D converters -- two of these devices are directed towards LED display DPM and DVM applications (ADD3501 3 1/2-digit DPM and ADD3701 3 3/4-digit DPM) while the other two (ADC3511 3 1/2-digit A/D and ADC3711 3 3/4-digit A/D) have addressable BCD outputs. These last two devices allow easy interface to microprocessor and calculator-oriented (COPS) systems.

Single or multiple channel monitoring of physical variables can be achieved with high accuracy despite the lack of complexity and low overall cost.

A/D CONVERSION

All A/D converters in this family operate from a single 5V supply and convert inputs from 0 to ±2V. The converters use a pulse-width modulation technique which requires no precision components and exhibits low offset, low drift, high linearity and no rollover error. An additional advantage is that the voltage reference is of the same polarity as the supply.

Two resolutions are offered: the 3 1/2-digit types divide the input into 2,000 counts plus sign, while the 3 3/4-digit types provide 4,000 counts plus sign which is roughly equivalent to the resolution of a 12-bit plus sign binary converter. The 3 1/2-digit converters require 200 ms per conversion; 3 3/4-digit types require 400 ms.

The converters handle negative inputs by internally switching the inputs and forcing the sign bit low. While this technique allows conversion of positive and negative inputs with only a single supply, the inputs must be floating with respect to the supply return. Without a floating supply, only positive voltages may be converted.

The basic converter is shown in *Figure 1*. The actual conversion technique is described in Appendix A.

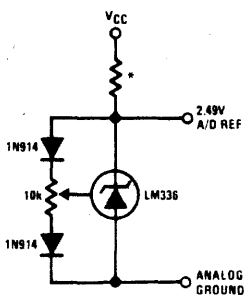
BCD OUTPUT DESCRIPTION

The ADC3511 and ADC3711 present the output data in BCD form on a single 4-line output port, plus a separate sign output. The desired digit is selected by a 2-bit address which is latched by a high level at the Digit Latch Enable input (DLE); a low level at DLE allows flow thru operation. Since the output is BCD, it is compatible with many standard instruments and can easily be converted into binary by the processor if this format should be desired. Overrange inputs are indicated by a hexidecimal "EEEE" plus an Overflow output.



A new conversion is begun by a positive pulse or high level at the Start Conversion (SC) input. The analog section of the converter continuously tracks the analog input. The Start Conversion command controls only the transfer of new data to the output latches, consequently the delay from the SC pulse to the Conversion Complete (CC) signal may vary from several milliseconds to several hundred milliseconds. In interrupt driven systems the delay is no problem, since the processor does not execute delay instructions while waiting for the data. However, if in-line or program I/O is used where the program waits for the data to be ready, the maximum delay between SC and CC must be programmed into the wait routine. This type of I/O is therefore not as efficient as interrupt I/O.

The CC output goes low immediately after the SC pulse. At the end of a conversion, CC goes high and remains high until a new conversion is initiated. Continuous conversion operation is obtained by tying the SC input to V_{CC}.

REFERENCE VOLTAGE

The 2.000V reference is derived from the LM336, a recently announced monolithic reference which provides 2.5V with low drift at low cost. This active reference is adjusted for minimum thermal drift of about 20 ppm/°C by using a third terminal on the device to adjust its output to 2.490V.

Total reference current consumption is low, as the LM336 requires only 1 mA of bias current, and the resistor divider about 2 mA. The reference circuit is shown in *Figure 2*. One reference can be used for many A/D's. The value of the upper series resistor R1 depends on the number of converters used.

$$*R1 = \frac{2.49V}{(2N+1)\ mA} \quad N = 1, 2 \ldots 8$$

FIGURE 2. A/D Converter Reference. The 10k Pot is Adjusted to a Voltage of 2.49V on the Output; at this Voltage Minimum Drift Occurs. The Reference can Supply up to 8 A/D Converters.

A SINGLE CHANNEL CONVERTER

A complete A/D port is seen in *Figures 3 and 4*. *Figure 3* shows a Dual Polarity converter and *Figure 4* a Positive Only Polarity converter. Each port contains an A/D converter, TRI-STATE® bus driver, and 2 gates to control I/O. This A/D port is easily used in single or multichannel systems. In multichannel systems a converter is used on every channel allowing digital multiplexing of the outputs.

Data from the A/D converter in a single channel system is easily processed using an OUT command to start a conversion and IN commands to read the data after the microprocessor has been interrupted by a Conversion Complete.

As seen in *Figure 5*, a single channel A/D port uses a 6-bit bus comparator to decode its assigned peripheral address from the lower address bits of the 8080A address bus.

When an interrupt is received, the present status of the processor is stored on the stack memory by a series of push commands. The interrupt is serviced by reading digit 4 (MSD) into the processor and checking the overflow bit. If the overflow bit is high, the converter input has exceeded its range and an error signal is generated, indicating that scaling must be done to attenuate the input signal. If the OFL is low, the sign bit is then checked to determine the polarity of the conversion. If the sign bit is low, a "1" is added to the MSB of digit 4. Since this bit would normally be low, (maximum converter range allows MSB $\leq$ 3 or 0011) a "1" in this position is used to denote a negative input voltage. The 4 bits of digit 4 which now include the sign are shifted into the upper half of the first byte and the 4 bits of digit 3 are packed into the lower half. Similarly, digits 2 and 1 are packed into the second byte and both bytes stored in memory.

Figure 6 and routine 1 are the flow chart and assembly language routine used to implement this action.

8-CHANNEL A/D WITH SOFTWARE PRIORITY

The basic A/D port can easily be expanded to multiple channel systems. An 8-channel system is seen in *Figure 7*. This system interrupts the processor when one of the Conversion Complete outputs goes high. The processor saves the current status and reads the status word of the A/D system. The status word is then compared to a priority table. Each level in the table corresponds to a priority level with high priority converters which are first in the table. If 2 or more converters have the same priority and are ready at the same time, the converter with the highest number gets serviced first.

The program determines which service routine to use by the bit position of "1's" in the status word. The routine loads the address pointer to digit 4 of the selected converter. The program then calls a subroutine which

goes through the process of checking overflow, sign and packs 4 BCD digits into 2 bytes. These 2 bytes are then stored in a table in the memory directly above the converter addresses. After a channel is serviced, the original processor status is restored and the interrupt enabled. If additional channels need service, they immediately interrupt so the new status word is then read and a new priority established.

Routine 2. 8-Channel Interrupt Service Routine with Software Priority (Continued)

ADJUSTMENT AND TESTING

Adjustment and testing of a single channel A/D is done by monitoring the memory space where the interrupt routine stores the data word. The microprocessor is forced to loop around a section of program with interrupts enabled. As the input voltage of the converter is changed, this data word should also change as the converter updates it. A precision voltage reference is connected to the input of the A/D and incremental voltage steps are applied. The A/D data word should also change according to the voltage steps.

At full-scale input voltage, the data word should be at its maximum value. If not, check the full-scale adjust on the A/D by adjusting it so the OFL bit goes high when the input is exactly 2.000V.

Multichannel systems are more difficult to check. Start by individually checking the full-scale adjustments so the converters overflow at 2.000V. Check the software priority routine by forcing all status bits of the status word high. This corresponds to all converters being ready at the same time, a very unlikely worst-case condition. The microprocessor should respond by outputting the address of all 4 digits of the A/D port with the highest priority along with the $\overline{\text{memR}}$ strobes, then with a $\overline{\text{memW}}$ strobe to start a new conversion. The next highest priority converter should then receive its addresses and $\overline{\text{memR}}$ strobes and so on down the line.

Once the priority routine has been debugged, each data word is monitored as the input to its converter is adjusted. Since a common input routine is used, once 1 channel operates, all the other channels should also.

Debugging may most easily be done by single stepping through the program at these critical areas. No timing problems should be encountered since the A/D port appears to be a standard peripheral or memory. In the ADC3511 and ADC3711 the desired output is merely addressed the same as a memory location.

The memory requirements of the interface depends, of course, on the complexity of the system. The single channel converter requires approximately 60 bytes of program storage plus 2 bytes for data storage and 4 peripheral addresses.

The multichannel system requires about 40 bytes for the priority routine and 10 bytes of program for each converter routine. The common input routine requires about 50 bytes of program and is used by all the converter routines in the form of a subroutine.

Memory mapped I/O causes 64 memory locations to be used to input an 8-channel system. The data space is located directly above the address space for the converters and 16 memory locations are used to store the data for 8 converters.

CONCLUSION

The ADC3511 and ADC3711 microprocessor compatible A/D converters eliminate the difficulties previously encountered in applying DPM chips to microprocessor systems. The low parts count and low cost per channel make distributed or remote A/D conversion practical for a variety of data acquisition applications.

APPENDIX A

THEORY OF OPERATION

A schematic for the analog loop is shown in *Figure A1*. The output of SW 1 is either at V_{REF} or 0V, depending on the state of the D flip-flop. If Q is at a high level, $V_{OUT} = V_{REF}$ and if Q is at a low level $V_{OUT} = 0V$. This voltage is then applied to the low pass filter comprised of R1 and C1. The output of this filter, V_{FB}, is connected to the negative input of the comparator, where it is compared to the analog input voltage, V_{IN}. The output of the comparator is connected to the D input of the D flip-flop. Information is then transferred from the D input to the Q and $\overline{Q}$ outputs on the positive edge of clock. This loop forms an oscillator whose duty cycle is precisely related to the analog input voltage, V_{IN}.

An example will demonstrate this relationship. Assume the input voltage is equal to 0.500V. If the Q output of the D flip-flop is high, then V_{OUT} will equal V_{REF} (2.000V) and V_{FB} will charge toward 2V with a time constant equal to R1C1. At some time V_{FB} will exceed 0.500V and the comparator output will switch to 0V. At the next clock rising edge, the Q output of the D flip-flop will switch to ground, causing V_{OUT} to switch to 0V. At this time, V_{FB} will start discharging toward 0V with a time constant R1C1. When V_{FB} is less than 0.5V, the comparator output will switch high. On the rising edge of the next clock, the Q output of the D flip-flop will switch high and the process will repeat. There exists at the output of SW 1 a square wave pulse train with positive amplitude V_{REF} and negative amplitude 0V.

The DC value of this pulse train is:

$$V_{OUT} = V_{REF} \frac{t_{ON}}{t_{ON} + t_{OFF}} = V_{REF} \text{ (duty cycle)}$$

The low pass filter will pass the DC value and then:

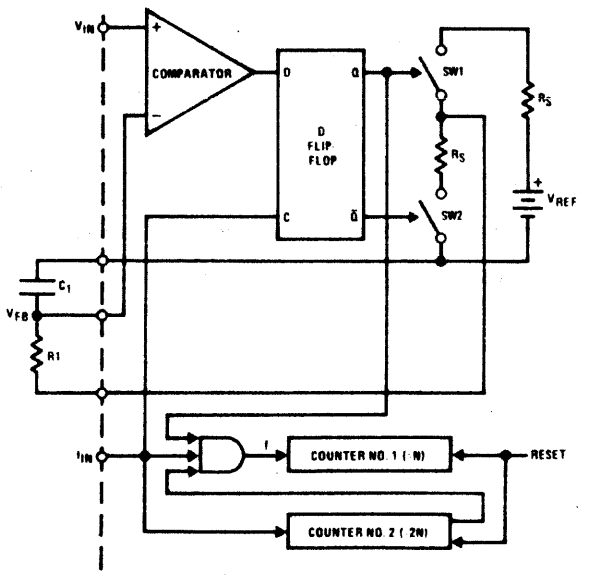
$$V_{FB} = V_{REF} \text{ (duty cycle)}$$

Since the closed loop system will always force V_{FB} to equal V_{IN}, we can then say that:

$$V_{IN} = V_{FB} = V_{REF} \text{ (duty cycle)}$$

or

$$\frac{V_{IN}}{V_{REF}} = \text{(duty cycle)}$$



The duty cycle is logically ANDed with the input frequency f_{IN}. The resultant frequency f equals:

$$f = \text{(duty cycle)} \times (f_{IN})$$

Frequency f is accumulated by counter no. 1 for a time determined by counter no. 2. The count contained in counter no. 1 is then:

$$\text{count} = \frac{f}{(f_{IN})/N} = \frac{\text{(duty cycle)} \times (f_{IN})}{(f_{IN})/N} = \frac{V_{IN}}{V_{REF}} \times N$$

For the ADC3511 N = 2000.
For the ADC3711 N = 4000.

$V_{IN} = V_{FB} = V_{REF} \times \text{(duty cycle)}$

$f = \text{(duty cycle)} \times f_{IN}$

$$\text{Count in Counter No. 1} = \frac{f}{f_{IN}/N} = \frac{\text{(duty cycle)} \times f_{IN}}{f_{IN}/N} = \frac{V_{IN}}{V_{REF}} \times N$$

CMOS Schmitt Trigger —a Uniquely Versatile Design Component

National Semiconductor
Application Note 140
Gerald Buurma

INTRODUCTION

The Schmitt trigger has found many applications in numerous circuits, both analog and digital. The versatility of a TTL Schmitt is hampered by its narrow supply range, limited interface capability, low input impedance and unbalanced output characteristics. The Schmitt trigger could be built from discrete devices to satisfy a particular parameter, but this is a careful and sometimes time-consuming design.

The CMOS Schmitt trigger, which comes six to a package, uses CMOS characteristics to optimize design and advance into areas where TTL could not go. These areas include: interfacing with op amps and transmission lines, which operate from large split supplies, logic level conversion, linear operation, and special designs relying on a CMOS characteristic. The CMOS Schmitt trigger has the following advantages:

- High impedance input ($10^{12}\Omega$ typical)
- Balanced input and output characteristics
  - Thresholds are typically symmetrical to 1/2 V_{CC}
  - Outputs source and sink equal currents
  - Outputs drive to supply rails
- Positive and negative-going thresholds show low variation with respect to temperature
- Wide supply range (3–15V), split supplies possible
- Low power consumption, even during transitions
- High noise immunity, 0.70 V_{CC} typical

Applications demonstrating how each of these characteristics can become a design advantage will be given later in the application note.

ANALYZING THE CMOS SCHMITT

The input of the Schmitt trigger goes through a standard input protection and is tied to the gates of four stacked devices. The upper two are P-channel and the lower two are N-channel. Transistors P3 and N3 are operating in the source follower mode and introduce hysteresis by feeding back the output voltage, out', to two different points in the stack.

When the input is at 0V, transistors P1 and P2 are ON, and N1, N2 and P3 are OFF. Since out' is high, N3 is ON and acting as a source follower, the drain of N1, which is the source of N2, is at $V_{CC}-V_{TH}$. If the input voltage is ramped up to one threshold above ground transistor N1 begins to turn ON, N1 and N3 both being ON form a voltage divider network biasing the source of N2 at roughly half the supply. When the input is a threshold above 1/2 V_{CC}, N2 begins to turn ON and regenerative switching is about to take over. Any more voltage on the input causes out' to drop. When out' drops, the source of N3 follows its gate, which is out', the influence of N3 in the voltage divider with N1 rapidly diminishes, bringing out' down further yet. Meanwhile P3 has started to turn ON, its gate being brought low by the rapidly dropping out'. P3 turning ON brings the source of P2 low and turns P2 OFF. With P2 OFF, out' crashes down. The snapping action is due to greater than unity loop gain through the stack caused by positive feedback through the source follower transistors. When the input is brought low again an identical process occurs in the upper portion of the stack and the snapping action takes place when the lower threshold is reached.

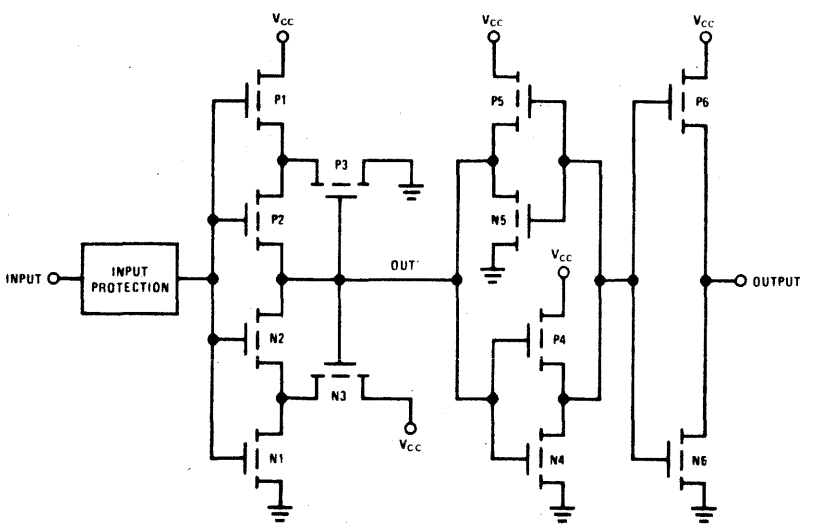

FIGURE 1. CMOS Schmitt Trigger

©IC MASTER 1979

Out' is fed into the inverter formed by P4 and N4; another inverter built with very small devices, P5 and N5, forms a latch which stabilizes out'. The output is an inverting buffer capable of sinking 360μA or two LPTTL loads.

The typical transfer characteristics are shown in *Figure 2*; the guaranteed trip point range is shown in *Figure 3*.

WHAT HYSTERESIS CAN DO FOR YOUR

Hysteresis is the difference in response due to the direction of input change. A noisy signal that traverses the threshold of a comparator can cause multiple transitions at the output, if the response time of the comparator is less than the time between spurious effects. A Schmitt trigger has two thresholds: any spurious effects must be greater than the threshold difference to cause multiple transitions. With a CMOS Schmitt at V_{CC} = 10V there is typically 3.6V of threshold difference, enough hysteresis to overcome almost any spurious signal on the input.

A comparator is often used to recover information sent down an unbalanced transmission line. The threshold of the comparator is placed at one half the signal amplitude (See *Figure 4b*). This is doen to prevent slicing level distortion. If a 4μs wide signal is sent down a transmission line a 4μs wide signal should be received or signal distortion occurs. If the comparator has a threshold above half the signal amplitude, then positive pulses sent are shorter and negative pulses are lengthened (See *Figure 4c*). This is called slicing level distortion. The Schmitt trigger does have a positive offset, V_{T+}, but it also has a negative offset V_{T-}. In CMOS these offsets are approximately symmetrical to half the signal level so a 4μs wide pulse sent is also recovered (see *Figure 4d*). The recovered pulse is delayed in time but the length is not changed, so noise immunity is achieved and signal distortion is not introduced because of threshold offsets.

APPLICATIONS OF THE CMOS SCHMITT

Most of the following applications use a CMOS Schmitt characteristic to either simplify design or increase performance. Some of the applications could not be done at all with another logic family.

The circuit in *Figure 5a* is the familiar sine to square wave converter. Because of input symmetry the Schmitt trigger is easily biased to achieve a 50% duty cycle. The high input impedance simplifies the selection of the biasing resistors and coupling capacitor. Since CMOS has a wide supply range the Schmitt trigger could be powered from split supplies (see *Figure 5b*). This biases the mean threshold value around zero and makes direct coupling from an op amp output possible.

In *Figure 4*, we see a frequency to voltage converter that accepts many waveforms with no change in output voltage. Although the energy in the waveforms are quite different, it is only the frequency that determines the output voltage. Since the output of the CMOS Schmitt pulls completely to the supply rails, a constant voltage swing across capacitor C1 causes a current to flow through the capacitor, dependent only on frequency. On positive output swings, the current is dumped to ground through D1. On negative output swings, current is pulled from the inverting op amp node through D2 and transformed into an average voltage by R2 and C2.

Since the CMOS Schmitt pulls completely to the supply rails the voltage change across the capacitor is just the supply voltage.

©IC MASTER 1979

Schmitt triggers are often used to generate fast transitions when a slowly varying function exceeds a predetermined level. In *Figure 7*, we see a typical circuit, a light activated switch. The high impedance input of the CMOS Schmitt trigger makes biasing very easy. Most photo cells are several kΩ brightly illuminated and a couple MΩ dark. Since CMOS has a $10^{12}\Omega$ typical input impedance, no effects are felt on the input when the output changes. The selection of the biasing resistor is just the solution of a voltage divider equation.

A CMOS application note wouldn't be complete without a low power application. *Figure 8* shows a simple RC oscillator. With only six R's and C's and one Hex CMOS trigger, six low power oscillators can be built. The square wave output is approximately 50% duty cycle because of the balanced input and output characteristics of CMOS. The output frequency equation assumes that $t_1 = t_2 >> t_{pd0} + t_{pd1}$.

We earlier saw how the CMOS Schmitt increased noise immunity on an unbalanced transmission line. *Figure 9* shows an application for a balanced or differential transmission line. The circuit in *Figure 7a* is CMOS EXCLUSIVE OR, the MM74C86, which could also be built from inverters, and NAND gates. If unbalanced information is generated on the line by signal crosstalk or external noise sources, it is recognized as an error.

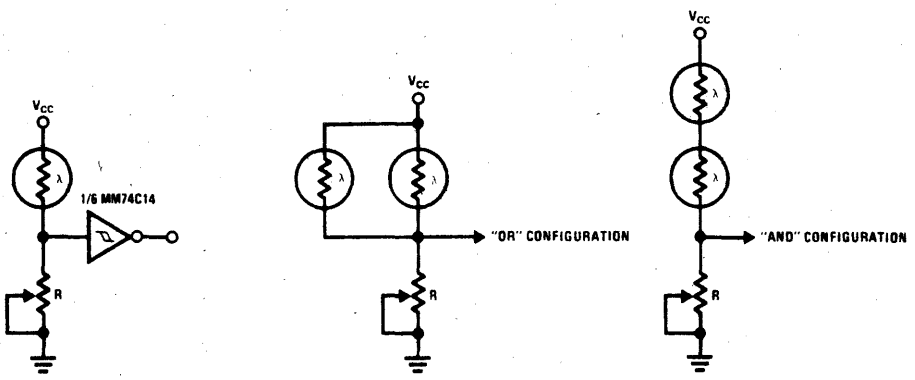

FIGURE 7. Light Activated Switch couldn't be Simpler. The Input Voltage Rises as Light Intensity Increases, when V_{T+} is Reached, the Output will go Low and Remain Low until the Intensity is Reduced Significantly.

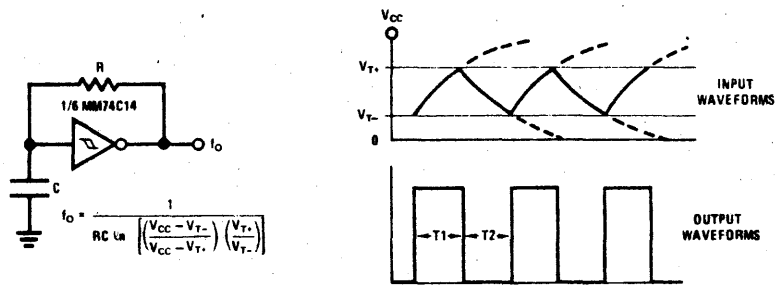

FIGURE 8. Simplest RC Oscillator? Six R's and C's make the CMOS Schmitt into Six Low Power Oscillators. Balanced Input and Output Characteristics give the Output Frequency a Typically 50% Duty Cycle.

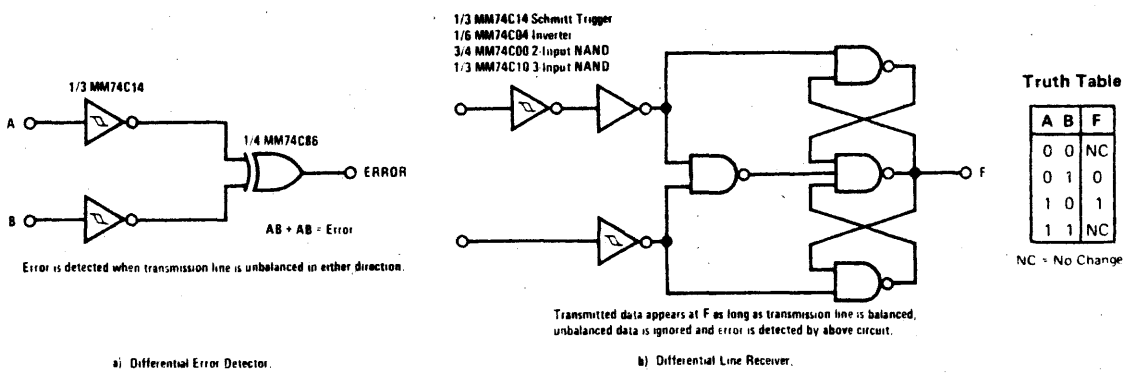

FIGURE 9. Increase Noise Immunity by using the CMOS Schmitt Trigger to Demodulate a Balanced Transmission Line.

The circuit in *Figure 9b* is a differential line receiver that recovers balanced transmitted data but ignores unbalanced signals by latching up. If both circuits of *Figure 9* were used together, the error detector could signal the transmitter to stop transmission and the line receiver would remember the last valid information bit when unbalanced signals persisted on the line. When balanced signals are restored, the receiver can pick up where it left off.

The standard voltage range for CMOS inputs is V_{CC} +0.3V and ground −0.3V. This is because the input protection network is diode clamped to the supply rails. Any input exceeding the supply rails either sources or sinks a large amount of current through these diodes. Many times an input voltage range exceeding this is desirable; for example, transmission lines often operate from ±12V and op amps from ±15V. A solution to this problem is found in the MM74C914. This new device has an uncommon input protection that allows the input signal to go to 25V above ground, and 25V below V_{CC}. This means that the Schmitt trigger in the sine to square wave converter, in *Figure 5b*, could be powered by ±1.5V supplies and still be directly compatible with an op amp powered by ±15V supplies.

A standard input protection circuit and the new input protection are shown in *Figure 10*. The diodes shown have a 35V breakdown. The input voltage can go positive until reverse biased D2 breaks down through forward bias D3, which is 35V above ground. The input voltage can go negative until reverse biased D1 breaks down through forward bias D2, which is 35V below V_{CC}. Adequate input protection against static charge is still maintained.

CMOS can be linear over a wide voltage range if proper consideration is paid to the biasing of the inputs. *Figure 11* shows a simple VCO made with a CMOS inverter, acting as an integrator, and a CMOS Schmitt, acting as a comparator with hysteresis. The inverter integrates the positive difference between its threshold and the input voltage V_{IN}. The inverter output ramps up until the positive threshold of the Schmitt trigger is reached. At that time, the Schmitt trigger output goes low, turning on the transistor through R_s and speeding up capacitor C_s. Hysteresis keeps the output low until the integrating capacitor C is discharged through R_D. Resistor R_D should be kept much smaller than RC to keep reset time negligible. The output frequency is given by

$$f_O = \frac{V_{TH} - V_{IN}}{(V_{T+} - V_{T-})\, R_{CC}}.$$

The frequency dependence with control voltage is given by the derivative with respect to V_{IN} So,

$$\frac{d\, f_O}{d\, V_{IN}} = \frac{-1}{(V_{T+} - V_{T-})\, RC},$$

where the minus sign indicates that the output frequency increases as the input is brought further below the inverter threshold. The maximum output frequency occurs when V_{IN} is at ground and the frequency will decrease as V_{IN} is raised up and will finally stop oscillating at the inverter threshold, approximately 0.55 V_{CC}.

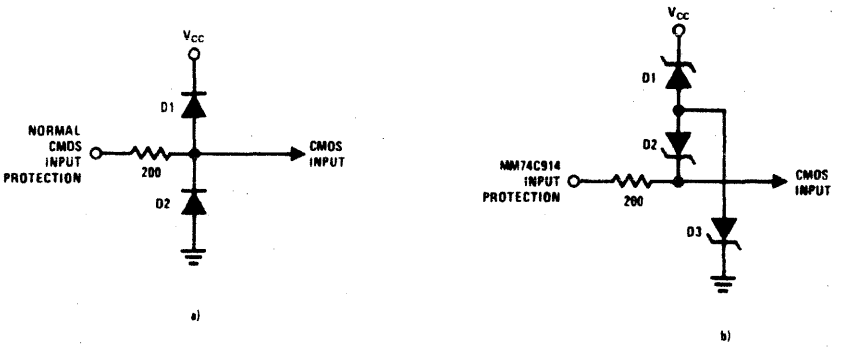

FIGURE 10. Input Protection Diodes, in a) Normally Limit the Input Voltage Swing to 0.3V above V_{CC} and 0.3V below Ground. In b) D2 or D1 is Reverse Biased Allowing Input Swings of 25V above Ground or 25V below V_{CC}.

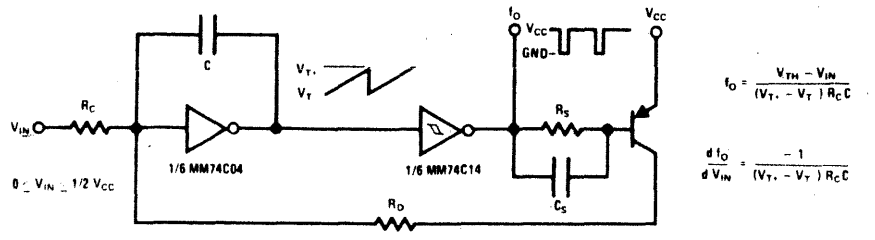

FIGURE 11. Linear CMOS (Voltage Controlled Oscillator)

©IC MASTER 1979

The pulses from the VCO output are quite narrow because the reset time is much smaller than the integration time. Pulse stretching comes quite naturally to a Schmitt trigger. A one-shot or pulse stretcher made with an inverter and Schmitt trigger is shown in *Figure 12*. A positive pulse coming into the inverter causes its output to go low, discharging the capacitor through the diode D1. The capacitor is rapidly discharged, so the Schmitt input is brought low and the output goes positive. Check the size of the capacitor to make sure that inverter can fully discharge the capacitor in the input pulse time, or

$$I_{SINK\ INVERTER} > \frac{C\,\Delta V}{\Delta T} + \frac{\Delta V}{R}$$

where $\Delta V = V_{CC}$ for CMOS, and ΔT is the input pulse width.

For very narrow pulses, under 100 ns, the capacitor can be omitted and a large resistor will charge up the CMOS gate capacitance just like a capacitor.

When the inverter input returns to zero, the blocking diode prevents the inverter from charging the capacitor and the resistor must charge it from its supply. When the input voltage of the Schmitt reaches V_{T+}, the Schmitt output will go low sometime after the input pulse has gone low.

THE SCHMITT SOLUTION

The Schmitt trigger, built from discrete parts, is a careful and sometimes time-consuming design. When introduced in integrated TTL, a few years ago, many circuit designers had renewed interest because it was a building block part. The input characteristics of TTL often make biasing of the trigger input difficult. The outputs don't source as much as they sink, so multivibrators don't have 50% duty cycle, and a limited supply range hampers interfacing with non 5V parts.

The CMOS Schmitt has a very high input impedance with thresholds approximately symmetrical to one half the supply. A high voltage input is available. The outputs sink and source equal currents and pull directly to the supply rails.

A wide threshold range, wide supply range, high noise immunity, low power consumption, and low board space make the CMOS Schmitt a uniquely versatile part.

Use the Schmitt trigger for signal conditioning, restoration of levels, discriminating noisy signals, level detecting with hysteresis, level conversion between logic families, and many other useful functions.

The CMOS Schmitt is one step closer to making design limited only by the imagination of the designer.

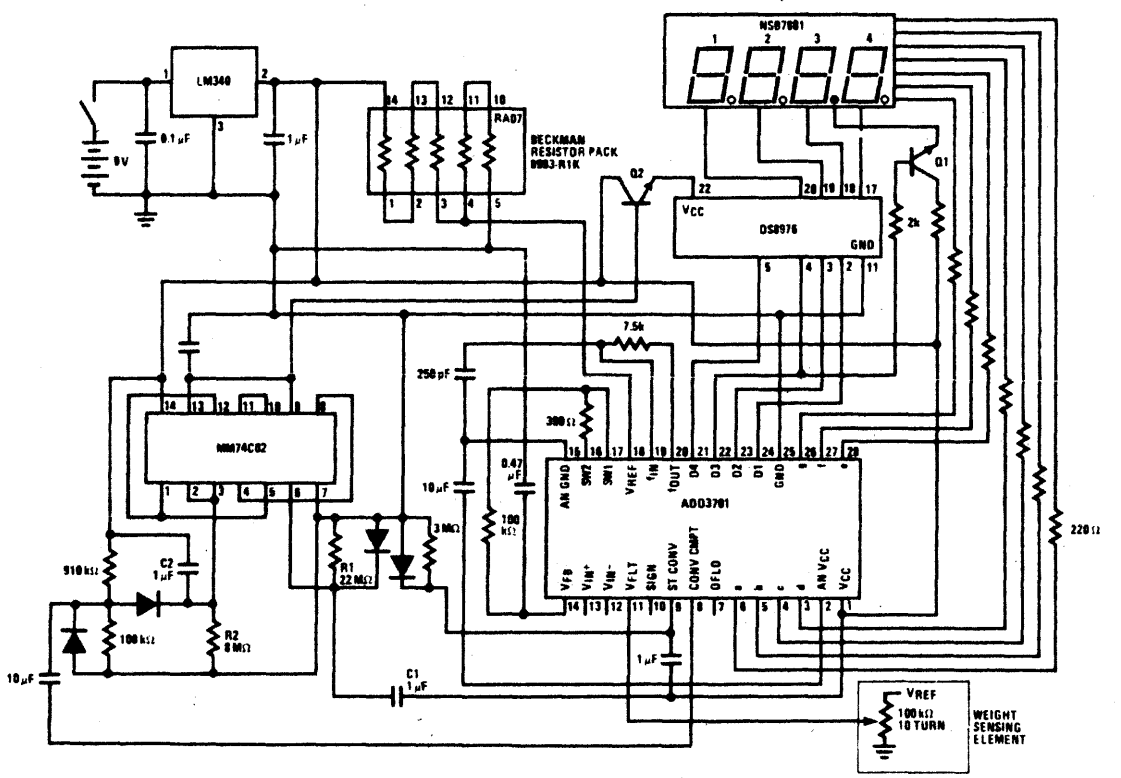
Digital Weight Scales

National Semiconductor
Carson Chen
March 1978



The application of digital systems to detect weight provides for low cost, accurate weight scales.

A developed system using the 3¾-digit DVM IC, ADD3701,* shown in figure 1, allows for conversion of an analog voltage to digital information linearly related to the weight being sensed.

Support circuitry for the DVM IC consists of a voltage regulator, a reference voltage, a weight sensing element, display drivers, and an LED display. Additional circuitry may be implemented for added features.

The weight scale circuit of figure 1 employs a potentiometer as the weight sensing element and functions as a variable voltage divider from ground to V_{REF}, 2 volts. An object placed upon the scale displaces the potentiometer wiper, which is connected to the scale mechanics, an amount proportional to its weight. Conversion of the wiper voltage to digital information is performed, decoded, and interfaced to the numeric display by the ADD3701. The LM340 regulates the V_{CC} supply voltage and the RA07 resistor array is connected as a voltage divider to generate the ADD3701 2V reference voltage. The NSB7881 is driven by the ADD3701 segment drivers and the DS8976 digit drivers.

*See ADD3701 data sheet for details of DVM operation.

Notes:

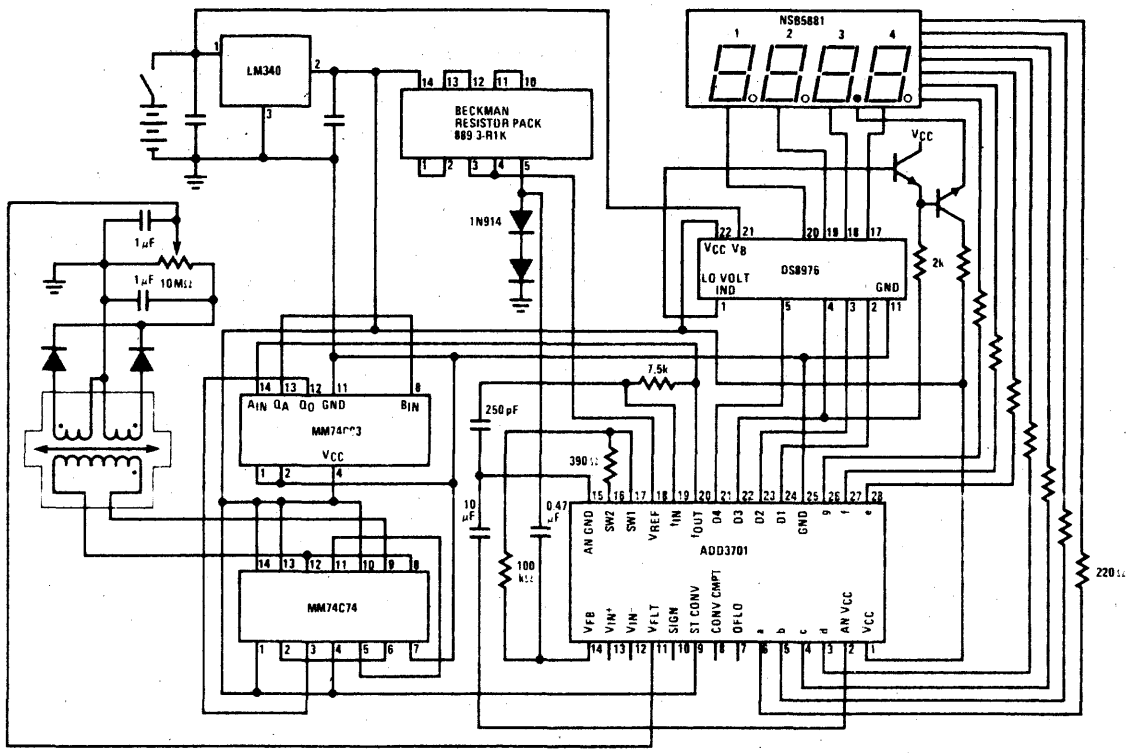
1. R1, C1 defines POWER ON display blanking interval. R2, C2 defines display ON time.
2. All V_{CC} connections should use a single V_{CC} point and all ground/analog ground connections should use a single ground/analog ground point.
3. Display sequence for Rev A ckt implementation:
   - t = 0 sec • power ON
   - t = 0 → 5 sec • display blanked • system converging
   - t = 5 → 10 sec • conversion complete • display ENABLE
   - t > 10 sec • display blanked • wait for new POWER UP cycle

Figure 1

©IC MASTER 1979

Q2, the MM74C02 and surrounding circuitry generate the display sequence explained in Note 3 of figure 1.

The ADD3701 3¾-digit DVM displays a maximum of 3999 counts, full scale, having a resolution of 500 μV per LSD.



With the decimal point of digit 3 forced "ON" by Q1 the maximum displayed reading of figure 1 would equate to 399.9 units of weight.

Figure 2 is a weight scale sensor similar to that in figure 1, differing only in the weight sensing element and its related support circuitry.

The transformer of figure 2 is rectified to a DC voltage, proportional to a weight displacement, and then converted to its digital equivalent with the ADD3701.

The purpose of setting analog ground two diode drops above digital ground is to help cancel the inherent air coupling offset voltage generated by the transformer.

Figure 2 is also connected to display a maximum of 399.9 units of weight. The accuracy of both systems without the transducer elements is ±1 LSD at 25°C ± 15°C.

Notes:

1. Excitation to the LVDT (i.e., outputs of the MM74C93 and MM74C74) may be altered to compensate for the varying frequency ranges of LVDTs.
2. All V_{CC} connections should use a single V_{CC} point and all ground/analog ground connections should use a single ground/analog ground point.

Figure 2

Dynamic RAM Board Design Made Easy

National Semiconductor
Memory Application
Stephen Calebotta*
November 1977

INTRODUCTION

Many new memory system designs are being done with dynamic RAMs. This is especially true as the new 16k RAM chips become more readily available. This application note is aimed at those engineers who are doing their first dynamic RAM designs. Its intent is to give some direction in how to design a RAM board so that it will give the greatest production yield with the least amount of difficulty.

We shall not talk about specific RAMs or interface to a specific processor. Most engineers can design control and interface logic for RAMs and most board designers can lay out a PC board for that design. However, the quality of that design will become apparent only after the RAM board is built and phased into production. Does it come up easily? Does it go through testing with little or no RAM chip fallout? Is it reliable in the field?

The key to success in a dynamic RAM system, or any other system for that matter, is margin. A system designed to maximize power supply and timing margins will be reliable and easy to manufacture. One that doesn't will be a manufacturing and field service nightmare.

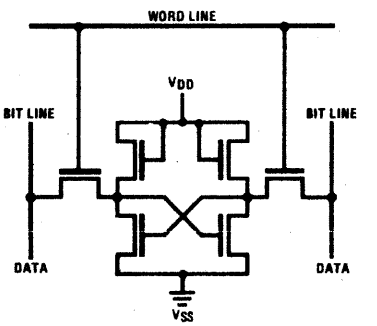
In this application note we shall discuss RAM chip characteristics, power supply and control signal distribution on PC boards, and control logic implementation suggestions. As successful examples, in the appendix we shall provide the schematics and foils for some memory boards that are in production.

RAM CHIP CHARACTERISTICS

For reference we shall compare dynamic and static RAMs at the chip level. Then we shall describe the unique characteristics of dynamic RAMs which must be considered in a memory system design.

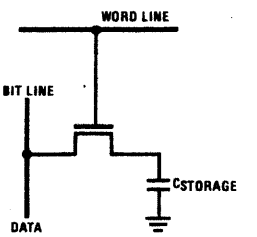
Dynamic RAMs versus Static RAMs

The basic difference between dynamic and static RAMs is the way they store data. The static RAM uses a flip-flop to store a bit, while the dynamic RAM uses a capacitor to store a bit. (See figure 1.)



It is their respective cell designs that give each RAM its advantages over the other. Let's compare the RAMs for ease of use, power dissipation, die size, and price.

Ease of Use: The static RAM is easier to use because no refresh logic is required. In addition, static RAM control signals tend to be easier to generate because cycling is usually unnecessary.



Power Dissipation: The dynamic RAM draws less power. The static RAM draws power continuously to sustain its flip-flops, while the dynamic RAM draws minimal power (1 to 2 mA) between cycles. With continuous cycling, the dynamic RAM draws about as much power as the static. However, in a large memory system, dynamic RAMs save total system power since only one bank of RAMs is ever accessed during a memory cycle. All other banks draw minimal current except during refresh cycles. The duty cycle for refresh is approximately 1½ to 3%.

Die Size: Dynamic RAMs tend to be smaller. Due to the difference in cell designs, the die size of the dynamic RAM is often at least 20% smaller than that of a comparable static RAM from the same manufacturer.

Price: Because of smaller die sizes and much larger production runs, dynamic RAMs should always remain considerably cheaper than comparable static RAMs. In addition, dynamic RAMs save money in larger systems. Less chip power means smaller and cheaper power supplies. Smaller supplies mean a further saving in reduced cooling requirements. In general, the larger the memory system, the greater the savings by using dynamics.

Static RAM Cell

Dynamic RAM Cell

Figure 1.

Dynamic RAMs

Refresh: Since charge leaks off the storage capacitors, it must be replenished periodically in order for a dynamic RAM chip to retain its data. The charge in any one cell is replenished, or refreshed, every time that cell is accessed for a read or a write. At the same time, all the other cells in the same row are also refreshed. For that reason the entire RAM chip can be refreshed by doing only 64 cycles (for 4k RAM; a 16k RAM needs 128

*Refer to Introduction.

©IC MASTER 1979

cycles) in 2 ms while sequencing through all the row addresses. The bit pattern presented to the column addresses does not matter. However, the setup and hold times must still be met. Unstable column addresses during refresh will cause data loss.

The hardware required for refresh amounts to a 6- or 7-bit counter for the refresh addresses, some way to multiplex the counter onto the RAM row address lines, a timer to signal when a refresh should be done, and the miscellaneous gating needed to couple into the usual read/write logic.

In some systems no extra refresh logic is needed. For example, in CRT systems normal operation sequences through all the row addresses in less than a 2 ms refresh period. This will be true only if the row address bits on the RAM chip are driven from the least significant address bits of the system. As a rule, this is good practice in all systems. By placing the most active system address bits on the RAM row addresses, normal system operation will automatically refresh the bulk of the RAM.

Cycling: One of the key functional differences between static and dynamic RAMs is the fact that dynamic RAMs must run through a cycle in order to read or write. Aborting the cycle by removing the chip enable too early or by trying to start a second cycle too soon after the first will probably cause data loss. Minimum chip enable on and off times must be observed.

Summary

Static RAMs are easier to use. Dynamic RAMs are cheaper, use less power, must be refreshed, and must be cycled.

MEMORY SUBSYSTEM DESIGN CONSIDERATIONS

Some memory board designs are easy to manufacture, while others, functionally identical, have low manufacturing yields seemingly due to the many "bad" chips. The difference between them is usually the amount of margin designed into each system. Power supply and timing margins are both critical, and as the margins go to zero or negative, the amount of "soft" errors goes up. (A chip has a "hard" error if a location consistently cannot be written and read back properly. It has a "soft" error if it only occasionally fails.)

On careful analysis, "soft" errors usually occur during a memory cycle in which some system parameter has gone out of spec. Since the RAM chips themselves have variations in their margins, replacing the offending RAM with one that has a greater margin in the out-of-spec parameter seems to cure the problem. This results in a large pile of "bad" RAMs. However, the real solution to this type of problem is in a careful system design and board layout in the beginning.

Power Distribution

By far the single most important aspect of a successful RAM system is good power distribution consisting of carefully designed decoupling and power gridding. The importance of good power distribution cannot be overemphasized.

Let's examine the problem. All dynamic RAMs have at least two supplies (V_{DD} and V_{BB}; V_{SS} is the RAM internal ground). Most also have a third called V_{CC}. We will discuss only V_{DD} since the other supplies have similar characteristics. Figure 2 shows the I_{DD} current waveform for a typical dynamic RAM chip during a memory cycle.

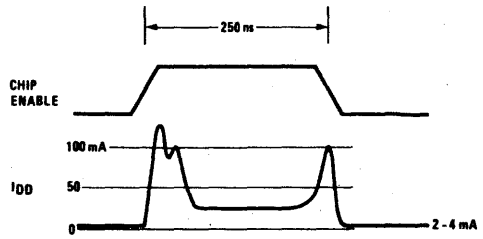


Figure 2.

At the beginning and end of chip enable, each RAM chip draws 50 to 100 mA current spikes with rise times of 20 ns. In addition, each RAM package draws a 20 to 40 mA DC current lasting for the duration of chip enable. The power distribution system must supply these currents while the voltages at the RAMs remain constant. Figure 3 is a schematic of the V_{DD} supply for a row of eight RAMs. The inductors are due to PC trace inductance which is about 10 nH per inch for a 13 mil trace. If the RAMs are on ½-inch centers there is 10 nH total between RAMs.

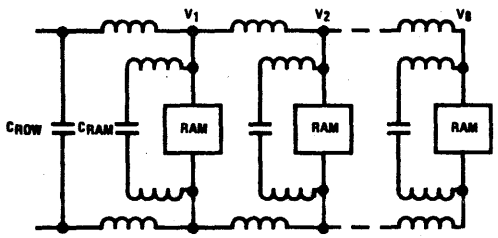

Figure 3.

If there is only one capacitor per row, and if that row capacitor, C_{row}, were infinite, the voltage spikes at the first, second, and last RAMs would be:

$$V_1 \text{ spike} = L \times 8\frac{di}{dt} = 10\,nH \times 8 \times \frac{100\,mA}{20\,ns}$$

$$= 400\,mV$$

$$V_2 \text{ spike} = L \times 15\frac{di}{dt} = 750\,mV$$

$$V_8 \text{ spike} = L \times 36\frac{di}{dt} = 1800\,mV$$

These spikes, especially the last two, are unacceptable.

If each RAM had its own decoupling capacitor, C_{RAM}, in series with 10 nH of trace inductance, the voltage spikes would be:

$$V_{spike} = L\frac{di}{dt} = 10\,nH \times \frac{100\,mA}{20\,ns} = 50\,mV$$

which is very good. Local decoupling should be used to overcome the spiking problem.

The ability of the power distribution system to supply the 20 to 40 mA per chip during a RAM cycle is also a function of the series inductance. For example, see figure 4.

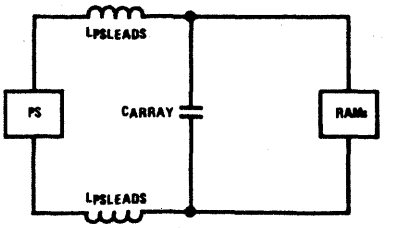

Figure 4.

Let the total power supply lead inductance be 50 nH. (We are ignoring the PC trace inductance within the RAM array itself.) What would the voltage step have to be at the RAMs to get 40 mA x 8 flowing in 20 ns? The equation is:

$$E = L\frac{di}{dt} = 50\,nH \times 8 \times \frac{40\,mA}{20\,ns} = 800\,mV$$

which is a large step which should not occur with adequately designed decoupling. Therefore, the bulk of the DC current for cycling the RAMs comes from decoupling caps themselves, and therefore they should be large enough to supply these currents with little droop. They should also be close enough to the RAMs to minimize the effect of the spikes. If we use a 0.1 μF cap, the droop for a 250 ns cycle would be:

$$V_{droop} = V = \frac{I}{C}t = \frac{40\,mA}{0.1\,\mu F} \times 250\,ns = 100\,mV$$

which is acceptable. Obviously, a larger capacitor will do an even better job of handling the droop. In addition, to help keep the droop to a minimum, the board should have about 50 to 200 μF of bulk decoupling on the +12 V supply. The other supplies can have less. Half should be placed near the point where the supplies enter the board. The other half should be placed at the far side of the RAMs so that the array lies between the bulk decoupling capacitors.

Alternatively, half of the bulk capacitors can be spread throughout the array. If this is done, use approximately 5 to 10 μF per eight RAM chips for V_{DD} and V_{BB}. For V_{CC}, 5 to 10 μF for 32 chips should be adequate.

Intuitively, this second approach seems better. However, the first technique works fine and is probably more cost effective.

The choice of capacitor types is very important. In all of the above decoupling calculations we have ignored the effective series resistance (ESR) of the capacitors. The effect of the ESR of real capacitors is probably at least as large as the effect of PC trace inductance and is a function of the capacitor type.

For best results, use ceramic capacitors for the local decoupling. The Memory Systems Group at National Semiconductor has had good results with ceramic capacitors of Z5U material from AVX and Sprague. To illustrate how important the Memory Systems Group feels these capacitors are to good memory board performance, every lot is subjected to an incoming inspection which includes, among other things, a transient response test.

For bulk decoupling, solid tantalum capacitors are recommended. They have better transient response than most other large value capacitors and they put a lot of capacitance into a small package which simplifies board layout.

A word about power gridding. If there are a number of rows of RAMs, all power supply traces to all RAMs should be run both vertically and horizontally throughout the array. Providing multiple paths through the array reduces the effective inductance of the power distribution system.

To summarize power distribution, we can say the following:

1. It is the single most important aspect of a good RAM board layout.
2. Use plenty of decoupling. The decoupling caps not only reduce voltage spikes, but also provide most of the RAM power during the cycling. Lay out the board for a 0.1 μF capacitor per power supply per RAM chip (up to three capacitors per chip). As production history accumulates, it may be possible to omit half the capacitors. However, lay out the board for one per supply per chip. Use 50 to 200 μF of bulk decoupling on +12 V. On +5 V and -5 V use 25 to 100 μF.
3. The decoupling capacitors should have the shortest possible traces back to their respective RAM power supply and ground pins. To reduce inductance further, these traces should be as wide as room will allow.
4. Traces running the power supply voltages throughout the array should be as wide as possible. However, with good decoupling design, even minimum trace widths will probably be acceptable. If some power supply traces can be wider than others, make V_{SS} (Ground) wider first, V_{DD} next, V_{BB} next, and finally V_{CC}. Ground is the key. Grid the supplies even if the traces are heavy in one direction and light in the other.
5. We have purposely omitted any discussion of multilayer boards. They tend to simplify power distribution problems, but the types of problems that must be solved are the same. Only the magnitudes have been somewhat reduced. Almost everything that has been said up to now is still applicable to multilayer boards.

Data and Control Signal Distribution

The second most important aspect of the successful RAM system is address, data, and control signal distribution.

Let's discuss the chip enables first. This is the most important signal to the RAM and all timing is referenced to it. There are two types of chip enables in common use today: 12 volt and TTL level swings. Running chip enable lines through an array tends to be less of a problem than one would think. There are only two things to keep in mind. First, place the actual driver chip near the RAM array it is driving, making the chip enable run short and direct. Second, put a damping resistor near the driver. Do this for either TTL level or 12 volt chip enables. Select the value of this resistor to

©IC MASTER 1979

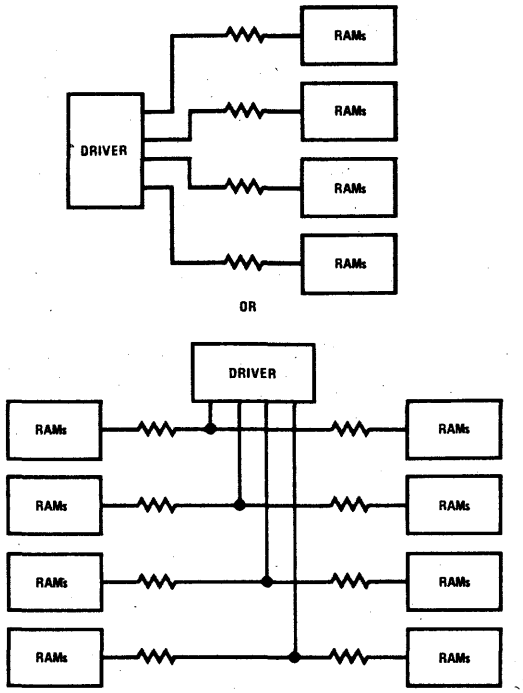

Figure 5.

give the best clock waveform at the RAM chips. Its value will probably be between 10 and 51 Ω. Figure 5 shows the commonly used arrangements.

The reasons for these two recommendations stem from the fact that, at the frequencies encountered here, the clock lines are, in fact, transmission lines. The impedance of the line is determined by:

$$Z_0 = \sqrt{L/C}$$

where the impedance of the clock line within the array of chips is in the range of 10 to 15 Ω while the unloaded line between the clock driver and the chip array is in the range of 30 to 50 Ω.

In order to drive the clock line cleanly, some attempt must be made to match the clock driver's output impedance to that of the line. The actual output impedance of most monolithic clock drivers varies as much as 3 to 1 and so we choose a fast clock driver with low output impedance and put a damping resistor in series to empirically set the effective output impedance to match the line (with only about 10% variation).

Long clock lines or long lengths of unloaded clock lines can cause problems. In the case of the long clock line, the open circuit at the far end of the line causes the reflection from the end of the line to return to the driver after the end of the rise time, resulting in ringing. In the case of the long unloaded length of line, the reflection from the junction of the unloaded and loaded sections of the line (due to the mismatch) causes glitches in the clock transitions.

To minimize crosstalk from chip enable to other signals, try to run chip enable at 90° to other signals. This is usually hard to do in an actual layout. As an alternative, leave as much room as possible between chip enable and adjacent traces as it runs through the array. Typically, signals in the array are on 50 mil centers. Moving the two adjacent signals more than 50 mils away from chip enable will help some in reducing crosstalk. However, as stated earlier, there seem to be very few problems associated with chip enable. Neither CE itself nor crosstalk to other signals will be troublesome if the above guidelines are observed.

Address, data, and control signals such as read/write (or equivalent) should be run as directly as possible. Their layouts tend to be non-critical. The critical thing is timing. The control logic should be designed to maximize setup and hold times with respect to chip enable. Again, high production yield is related to margins. As an example, consider a RAM board that was built for an 8080 system. The chip used was MM5271 4k RAM which has a low true TTL level clock input. The signal that controls read, write, and refresh is called TSP. The MM5271 data sheet says that the setup time for TSP is zero ns with respect to the leading edge of chip enable. When doing a refresh, TSP must be low at the beginning of chip enable. The original timing brought TSP down at the same time as chip enable. The system seemed to work. However, it would make an error once every half hour or so. With an oscilloscope everything appeared to be within specification. When TSP and chip enable were superimposed on the scope, their leading edges were absolutely coincident in both time and waveshape. The TSP/chip enable relationship was examined very, very carefully and pronounced okay. Finally, in an attempt to cure the problem, the TSP timing was changed to give about 50 ns of setup time and the problem disappeared.

The point was that the original design was done to the limit of the memory data sheet even though there was no need to do so. The success of the operation depended on the shape of the two waveforms to keep the system in spec. Once margin was designed in, with no hardship at all in the design, the system operated flawlessly.

In high-speed systems where it is hard to design in extra margin, use damping resistors in address, data, and control lines to help control their waveshapes. A resistor in every address, data, and control line allows these waveforms to be optimized, which gives the system improved margin over an undamped design. Use damping resistors only where necessary. Leave them out of signals that have time to settle down before they are needed.

Summarizing the use of damping resistors: always put them in chip enable lines, whether they are TTL levels or 12 V levels. Use them as necessary in those address, data, and control lines whose timings are approaching the limits of the RAM chip data sheet. Design in margin first. Tune it in when it can't be designed in.

LOGIC CONSIDERATIONS

These also affect yield. For example, a RAM cycle must never be aborted before its normal completion. The control logic must be designed to never permit a shortened cycle. At this point we shall briefly discuss some techniques for timing and control.

Timing Generation

The actual phasing of control signals can be done a number of ways. Existing system level control signals can be used. This is easy in some 8080 and PACE systems. When the available system control signals aren't quite up to the job, another technique that works

quite well is to use a high frequency oscillator and a shift register connected as a Johnson counter. Any timing signal that is necessary can be generated from a Johnson counter using a 2 input gate. This technique has a minor drawback if the high frequency oscillator is asynchronous with respect to the main system timing. The RAM cycle timing will always have a finite uncertainty with respect to the system cycle timing. This uncertainty is equal to the clock period of the high frequency oscillator. To apply the same technique but to avoid the timing uncertainty, use a gated delay line oscillator instead of a crystal or RC oscillator. Delay line oscillators can be started and stopped reliably. Crystal and RC oscillators take a few cycles to settle down and therefore are not reliable in a start-stop mode. How about one-shots? Do not, under any circumstances, use one-shots in critical timing applications!

Refresh Timeouts

A counter and oscillator are best. An astable oscillator is acceptable but must be carefully designed for worst case minimum frequency with respect to temperature to ensure the RAM gets refreshed often enough. At the end of the timeout a flip-flop should be set. When the refresh cycle is finally completed, that flip-flop should be reset. The timing should be such that it doesn't matter when the RAM gets refreshed within the refresh timer period.

Transparent versus Non-Transparent Refresh

Most microprocessors have predictable periods of time when they will not access the RAM board. Usually it takes little effort to insert refresh cycles in these times, thereby making refresh transparent to the CPU. When the CPU is very fast and is using the bus almost continuously, the refresh will have to hold up the processor. Even then, some clever design will minimize the time spent doing non-transparent refresh.

Single Step

Some systems need the capability of single stepping through programs. Since dynamic RAMs must be refreshed continuously, the output data from RAM should be latched. This permits single stepping because every time the address changes, the RAM is read and the data is latched. Then the refresh proceeds behind the latches, never disturbing the data. The RAM appears static.

DMA

DMA should be little different from normal cycles. One thing that must be considered is how to handle refresh. Three techniques immediately come to mind. First, have the DMAing device permit refresh periodically. Second, limit the DMA frequency. Make the period between DMA cycles equal to a normal RAM cycle plus a refresh cycle. This way the refresh can be handled transparently to the DMA. The third technique would be to limit the DMA time to something under 2 ms and at the end of the DMA do a burst refresh of the entire memory. There are a number of other ways to handle refresh and DMA. Performance of the system will determine which technique is most appropriate.

From a system standpoint, the most important aspect of DMA and dynamic RAMs is the polarity of the system level control signals. In a TTL system where bus control can change hands, the control signals must be *low true*. The reason for this is that, as control transfers from the CPU to the DMA device and back again, there will be short periods of time when the control lines are floating since neither device is driving the lines. In a TTL system, floating lines look high. If control signals have been defined as high true, then as the lines momentarily float, devices such as our RAM board will think that a command has been issued and will start an unintended cycle. Then the problem gets compounded. During the unintended cycle comes the command for a real cycle. Either the unintended cycle will be aborted, which destroys some RAM contents, or the intended cycle will start too late, causing other problems in the external system. An example of a bus with this problem is the S100, or hobby standard bus. It mixes signal polarities and, therefore, makes dynamic RAM control logic unnecessarily complex. If there is only one controlling device, signal polarities are academic. But if control can transfer, make the control lines low true.

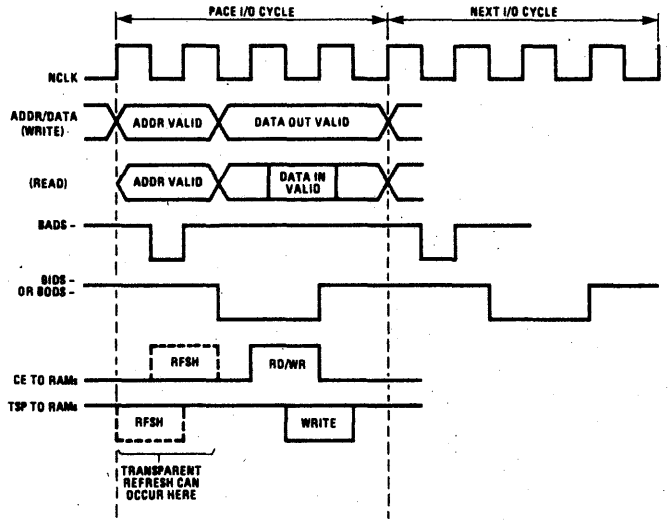
SUMMARY

Refresh requirements make dynamic RAMs slightly harder to use than static RAMs. However, they pay the designer back for his efforts by reducing overall system cost in three ways. First, dynamic RAMs tend to be cheaper than static RAMs of the same size. This is primarily due to smaller chip sizes and higher production volumes than comparable static RAMs. Second, dynamic RAMs use less power. When a dynamic RAM is not being accessed it draws much less current than a static RAM. During access, dynamic and static RAMs draw similar amounts of power. However, in a large array, only that bank being accessed draws full power. All others still draw standby currents so that the total system power is lower than for a comparable static system. Because of the reduced power requirements, power supplies are cheaper. And, third, due to lower power dissipation, cooling requirements are reduced, allowing a further saving.

There are three things the system designer can do to maximize RAM board yields during manufacture. First, design proper power supply decoupling. This is probably the single most important consideration for the designer. A good high frequency 0.1 μF capacitor per supply per memory chip is recommended. A capacitor per supply per two chips is probably okay, but the board should be laid out for one capacitor per supply per chip and then capacitors can be left out as yield data becomes available. For bulk decoupling use about 50 to 200 μF per board on +12 V, less on +5 V and -5 V.

Second, design in as much margin as possible in all control signal timing. Use damping resistors where necessary. If timing is designed right to the minimum specs, periodically the right combination of data pattern, power supply noise, temperature, cosmic radiation, etc., causes the system to fail. The combined worst case parameters push a signal beyond specification and the memory fails.

Third, never allow spurious, shortened memory cycles to occur. Shortened or aborted memory cycles are guaranteed to destroy data in the row that was addressed during the aborted cycle.



Any designer who uses reasonable care can successfully design dynamic memory systems which will be easy to manufacture and very reliable in the field.

APPENDIX A

Appendix A shows a simplified timing diagram and schematics for a 16kx8 RAM board used by a PACE microprocessor for byte mode data storage.

RAMs are MM5270 4k RAMs with 12 V chip enables. All timing is generated from existing system signals. DMA is not now in use, but is possible in the future. Control signals from the bus are low true. Refresh is transparent, done at any time in the absence of any address, data in, or data out strobes, coincident with the rising edge of clock.

MM5290 16K RAM Functional Description

National Semiconductor
B. Johnston

INTRODUCTION

This functional description covers the operation of the MM5290 16k dynamic RAM currently manufactured by National Semiconductor. This device is directly interchangeable with the MK4116. The National design has some internal differences, but these are transparent to the user, making the MM5290 a direct replacement for the MK4116.

Block Diagram

The block diagram shown in *Figure 1* shows the functional relationship between major blocks of circuitry in the MM5290. The multiplexed address, unlatched output and gated $\overline{CAS}$ features are shown. The row decoder column decoders and two 64 x 128 memory arrays with sense amplifiers between them are drawn in blocks that indicate their actual physical relationship on the die. This arrangement, with sense amplifiers in the middle and column decoders duplicated along each side, reduces cross talk (coupled noise) between address and column lines. Noise margin is improved because column line length is minimized.

Clock Generation

The MM5290 has multiplexed addressing necessitating separate row (Row Address Strobe, $\overline{RAS}$) and column (Column Address Strobe, $\overline{CAS}$) strobes. The timing relationship between these two strobes is made non-critical by gating $\overline{CAS}$ with the internal $\overline{RAS}$ clock. This is shown in *Figure 1*, along with the fact that $\overline{CAS}$ gates the write enable ($\overline{WE}$) control. These three signals are the source of the internal clocks (row, column and write clocks). Another way to describe this is: 1) the row clocks are referenced to $\overline{RAS}$; 2) the column clocks are referenced to either $\overline{RAS}$ or $\overline{CAS}$, depending on the $\overline{RAS}$ to $\overline{CAS}$ delay; and 3) the write clocks are referenced to $\overline{CAS}$ or $\overline{WE}$, depending on which occurs later. The block diagram in *Figure 1* indicates which blocks of circuitry the internal clocks control.

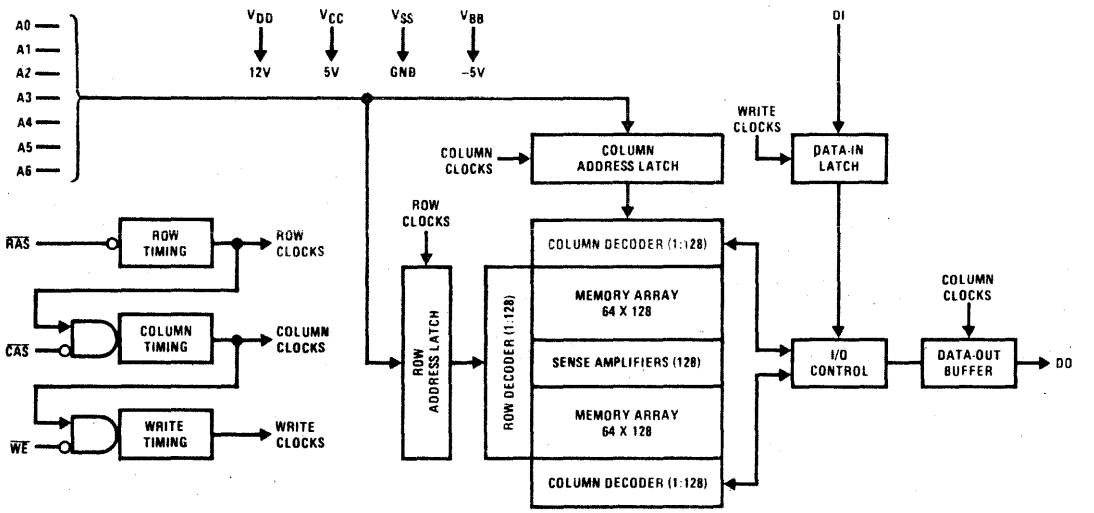

FIGURE 1. MM5290 Block Diagram

©IC MASTER 1979

Memory Cell

The basic memory cell consists of a transistor and capacitor as shown in *Figure 2*. Data is stored by selecting a cell and charging or discharging the storage capacitor C_S through transistor Q1. Q1 is then turned OFF (cell deselected) and data is retained until charge is lost through leakage current or the cell is refreshed. Each memory cell must be refreshed every 2 ms to guarantee data retention.

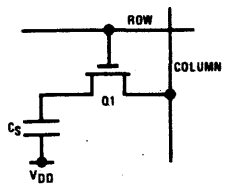

FIGURE 2. Basic Memory Cell

Cell Selection

Figure 3 shows a block diagram indicating how an individual memory cell is selected (addressed). First, the row address is latched in by $\overline{RAS}$. This is decoded to select 1 out of the 128 rows. Actually, there are 128 cells tied to each row so that 128 cell transistors (Q1 in *Figure 3*) are turned ON. Second, the column address is latched in. This is decoded to select 1 of the 128 columns. The row and column coincidence selects an individual cell for either reading or writing data.

Read Operation

Figure 4 shows a simplified version of the array of cells with the read/write circuitry. The array consists of 16,384 memory cells plus 2 rows of 128 reference cells. These are separated into 2 arrays by 128 sense amplifiers as shown. If row address AX5 is a logic "0", a row in the top half of the memory is being selected while the reference cells on the other side of the sense amplifier are also selected. Data is stored in complementary form in this half (top) of the array. The other half (bottom) of the array stores the data in true form when row address AX5 is a logic "1". A logic "0" in the array is defined as 0V stored in the cell and a logic "1" as +V.

Although the usual time reference in a cycle of operation is the high-to-low transition of $\overline{RAS}$, the prior events of discharging all row lines (to 0V) and precharging all column lines (to V_{DD}) must occur before a cycle of operation can be successfully completed. The starting point then is all row lines discharged and all column lines precharged. Then a row address is latched and the 128 cells connected to the selected row line are "read" by the 128 sense amplifiers. This also refreshes them. When a column address is latched, 1 of the 128 columns is connected to the I/O bus and the data of the selected cell becomes available on the DO pin.

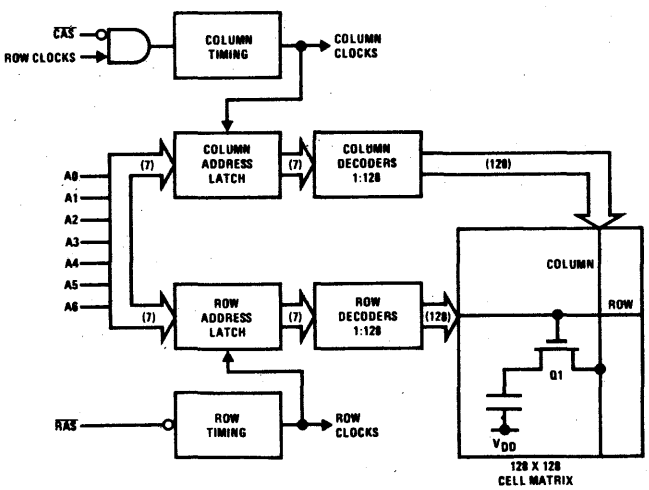

FIGURE 3. Block Diagram of Cell Selection

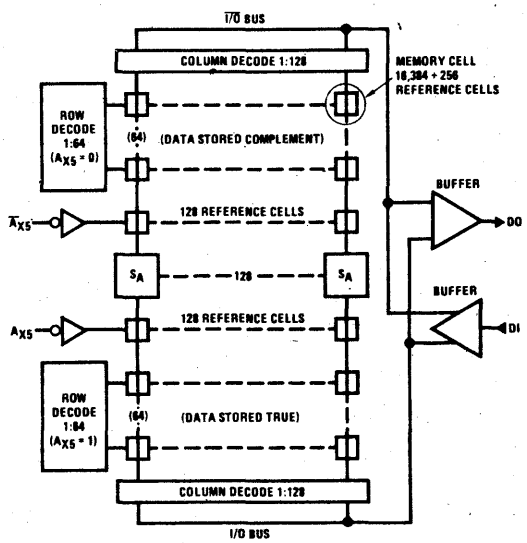

FIGURE 4. Simplified Read-Write Circuitry

©IC MASTER 1979

Sense Amplifier Operation

Figure 5 shows a simplified version of a sense amplifier together with a selected memory cell and the reference cell associated with "reading" the cell. When the cell is selected by the row address, a reference cell on the opposite side of the differential sense amplifier is also selected. (In fact, the entire row of 128 reference cells is selected.) If the selected memory cell contains a "1", then the storage capacitor C_S has the same potential as the left column line and no charge is transferred through Q1. If the selected cell contains a "0", then charge will be transferred through Q1 and shared between C_S and C_{CL}. The voltage of the column line will be reduced by ΔV where ΔV is a function of the ratio of C_S to C_{CL}.

Simultaneousiy with the events happening with the memory cell and the left column line, the right column line will always be reduced by 1/2 ΔV because charge will be transferred through Q2 between the capacitor of the reference cell labeled 1/2 C_S and C_{CL}. (All reference cells begin the cycle with a "0" stored on the storage capacitor.) This means that the sense amplifier will have a voltage difference of $\pm 1/2\ \Delta V$ across it with the polarity depending on the data stored in the memory cell. The sense amplifier regeneratively amplifies the difference and restores the data in the memory cell. This signal is also amplified by the output buffer and made available at the output pin (DO).

Write Operation

Figure 6 shows a block diagram of the write circuitry. The Data In buffer drives the column line of the selected cell either low (to ground) or high (to V_{DD}) depending on the logic level of DI. Transistor Q1 is ON because the cell has been selected and the storage capacitor C_S is written to the voltage of the column line. Then Q1 is turned OFF and C_S retains the data.

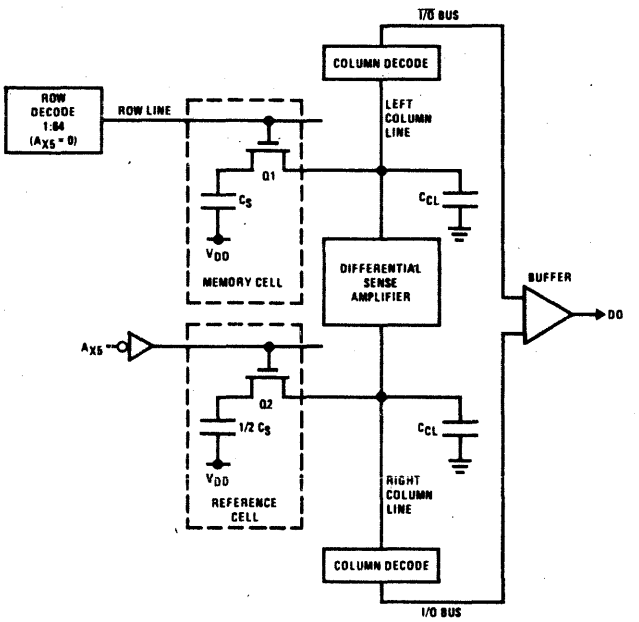

FIGURE 5. Simplified Read Circuitry

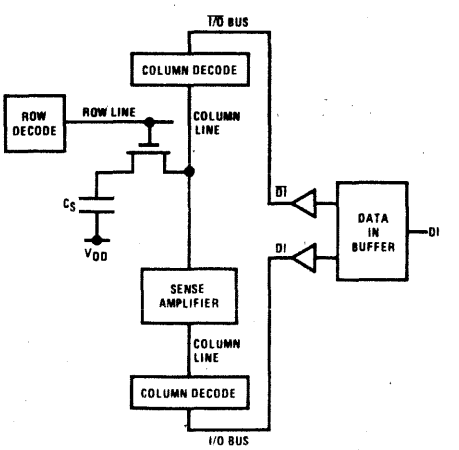

FIGURE 6. Simplified Write Circuitry

©IC MASTER 1979

Refresh

One side of the storage capacitor of the memory cell is a polysilicon V_{DD} line. The other side is a diffused junction (the drain of a transistor). The leakage of this junction normally increases with temperature and limits the data retention. This "dynamic" nature of the data storage requires that the cells be refreshed periodically (every 2 ms with today's technology) to retain data. A row of cells (128) is refreshed whenever any valid $\overline{RAS}$ cycle occurs. This means it takes 128 cycles to refresh the MM5290. Operating power is reduced and the output kept in the high impedance state when $\overline{CAS}$ is kept high and $\overline{RAS}$ is cycled for each of the 128 row addresses ($\overline{RAS}$ Only Refresh) to refresh the memory.

Most of the circuitry used in the MM5290 is dynamic and must also be "refreshed" for the memory to function properly. This is accomplished automatically when the dynamic cells are refreshed. This dynamic circuitry requires several cycles after power-up or after the refresh limit has been exceeded before proper device operation can be assured.

Read Timing

The read cycle timing is indicated in *Figure 7*. The cycle begins with $\overline{RAS}$ going low. This latches the row address. The address bus must be stable at this time: $\overline{CAS}$ then switches low sometime later. Again the address bus must be stable at the time $\overline{CAS}$ goes low because the column address is latched at that time. $\overline{WE}$ must be high coincidentally with $\overline{CAS}$ low during the read cycle. Data Out (DO) will be valid before t_{CAC} (access time from $\overline{CAS}$) or t_{RAC} (access time from $\overline{RAS}$) whichever is limiting. The output will return to TRI-STATE® in t_{OFF} time when $\overline{CAS}$ switches high. The valid data can be maintained to the end of the cycle (in fact, into the next cycle) because t_{CRP} minimum ($\overline{CAS}$ to $\overline{RAS}$ precharge time) is specified as a negative quantity in the data sheet.

Write Timing

There are 3 types of write cycles specified in the data sheet. These are called an Early Write, a Read-Write and a Read-Modify-Write cycle.

The Early Write cycle is characterized by $\overline{WE}$ going low no later than t_{WCS} minimum ($\overline{WE}$ to $\overline{CAS}$ set-up time) before $\overline{CAS}$. This could be called a "write only" cycle. The output remains in the high impedance state throughout the cycle while data is written into the desired location *(Figure 8a)*. D_{IN} is latched when $\overline{CAS}$ goes low and must be stable then rather than being referenced to $\overline{WE}$. The $\overline{WE}$ pulse width must be a minimum of t_{WP} and both the leading and trailing edges of $\overline{WE}$ have several timing constraints with respect to $\overline{RAS}$ and $\overline{CAS}$. Refer to the data sheet for these specifications.

The Read-Write cycle *(Figure 8b)* occurs when $\overline{WE}$ is delayed for at least t_{RWD} minimum ($\overline{RAS}$ to $\overline{WE}$ Delay) from $\overline{RAS}$ and the t_{CWD} minimum ($\overline{CAS}$ to $\overline{WE}$ Delay) from $\overline{CAS}$. The data in the selected location is first read; then new data is written into the location. The read portion of the cycle is explained in the section on Read Cycle Timing. The write portion of the cycle begins with data being latched in when $\overline{WE}$ falls and ends with the end of the cycle. The detailed timing is shown in the data sheet.

The Read-Modify-Write cycle *(Figure 8c)* is the Read-Write cycle extended in time so that the data in a particular location can be read, modified if necessary, and then written back into the same location. This requires that the $\overline{WE}$ pulse be delayed the minimum time of t_{RWD} from $\overline{RAS}$ and t_{CWD} from $\overline{CAS}$ plus an additional time shown as t_{MOD}. The additional time is the time required by the system to check the data, modify it as necessary and place it on the input data bus consistent with the required set-up time before $\overline{WE}$ goes low. Note that t_{MOD} is a system parameter. Detailed timing is given in the data sheet.

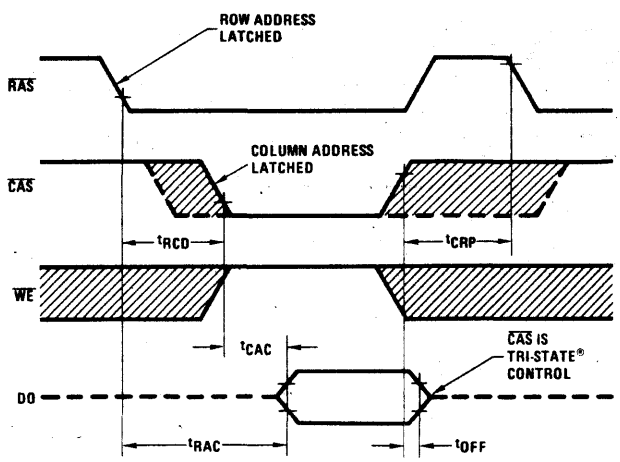

FIGURE 7. Read Cycle

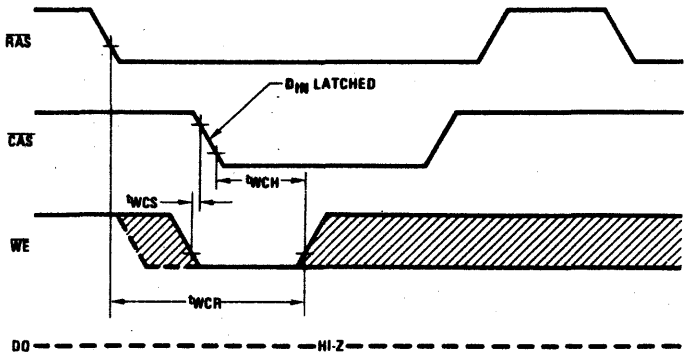

FIGURE 8a. Early Write

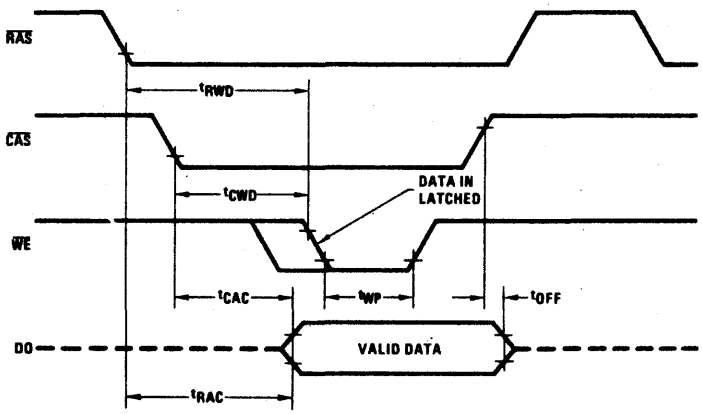

FIGURE 8b. Read-Write

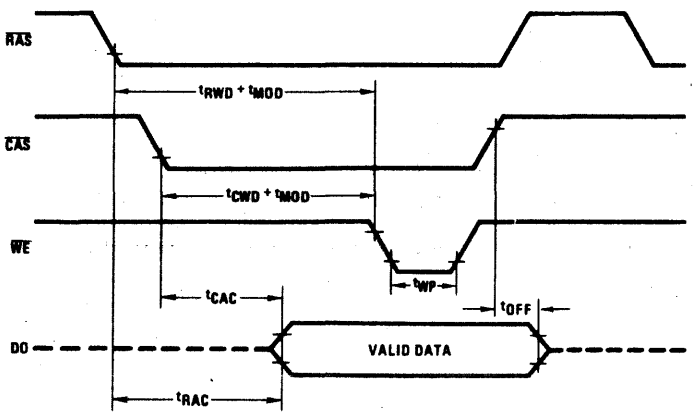

FIGURE 8c. Read-Modify-Write

©IC MASTER 1979

Page Mode Timing

The MM5290 functions in a page mode operation with up to 128 bits (1 row) per page. Data may be read or written in this mode of operation.

Figure 9 shows the timing for a page mode Read cycle. The cycle starts like a normal read cycle with the access time of the first bit (bit 0) either t_{RAC} or t_{CAC} whichever is limiting. The rest of the page mode read is accomplished by keeping $\overline{RAS}$ low and cycling $\overline{CAS}$ an additional 127 times while changing to a new column address each time. $\overline{WE}$ may be held high continuously or cycled. If $\overline{WE}$ is cycled, it must meet the timing constraints shown in the data sheet. $\overline{RAS}$ cannot be held low for more than 32 μs so that the maximum $\overline{CAS}$ cycle time is approximately 250 ns to read the full 128 bits of data in a page (row).

Figure 10a shows the timing for a page mode Early Write cycle. The cycle begins as a normal early write cycle. The rest of this mode of operation is accomplished by keeping $\overline{RAS}$ low and cycling $\overline{CAS}$ an additional 127 times while changing to a new column address each time. The input data (D_{IN}) must be referenced to the falling edge of $\overline{CAS}$ and not $\overline{WE}$. $\overline{WE}$ may be held low or pulsed. The output will remain in the high impedance state throughout the cycle.

Figure 10b shows the timing for a page mode Read-Write cycle. The cycle begins as a normal read-write cycle. Then $\overline{RAS}$ is held low and $\overline{CAS}$ is cycled an additional 127 times while a new column address is selected each time. $\overline{WE}$ must be kept high for the t_{CWD} time (to guarantee the data is read) and then switched low for t_{WP} time to accomplish writing the new data. The data to be entered (D_{IN}) must be referenced to $\overline{WE}$ with the appropriate set-up and hold times shown in the data sheet. Extending the t_{CWD} time to allow for modifying data and then writing it back into the same location would make this a Read-Modify-Write page mode cycle.

Refresh Timing

The MM5290 must be refreshed every 2 ms. Any valid cycle of $\overline{RAS}$ will refresh a row of 128 bits. It requires 128 cycles, (1 for each row of the matrix) to refresh the entire memory. *Figure 11* shows $\overline{RAS}$ only refresh. Only $\overline{RAS}$ switches. $\overline{CAS}$ is held high which reduces I_{DD} and TRI-STATES the output.

Current Transients

Figures 12 and 13 show the current waveforms for I_{DD}, I_{SS} and I_{BB}. When the MM5290 is operated with $\overline{CAS}$ limited timing, the transients associated with the row and column clocks are separated in time. The major events causing the transients are indicated in *Figure 12*. When the operation is $\overline{RAS}$ limited, some of the transients overlap. This is shown in *Figure 13*. The transients are then additive and maximum transient peaks occur. Adequate capacitive decoupling* at the board level is necessary to maintain power supply voltage transients within the data sheet specification of ±10%.

Bit-Slice Microprocessor Design Takes a Giant Step Forward with "Schottky-Coupled-Logic" Circuits

National Semiconductor
Application Note 203
Dale Mrazek
July 1978

A new four-bit slice "Schottky-coupled-logic" design combines the flexibility of the industry standard 2900 microprocessor architecture with advanced LSI processing. It implements low-power Schottky TTL circuitry on the same devices as a proprietary TRI-STATE™* emitter coupled logic design to achieve a 30 to 50 percent improvement in speed with no increase in power dissipation. It also allows the use of advanced "pipeline prediction" techniques in microprogram control design to significantly reduce microcycle times.

In most computer applications, cost, speed, power consumption and utility are the key factors. In some applications cost is the dominant consideration. In others it is speed or power consumption.

In bipolar four-bit slice microprocessor-based systems, this is particularly true. To date, however, designers have had to make a choice between the high speed of emitter coupled logic or the low power consumption and low cost of low power Schottky TTL four-bit designs such as the industry standard 2900 series.

But with current approaches it has not been very practical to have both.

If the designer chose an ECL design, he paid a price for the high speed with higher power consumption and loss of board design flexibility. If one of the LS bipolar 2900 designs currently available was chosen, low power could be achieved, but only at the price of considerably reduced system throughput.

Now, however, computer system designers can have both ECL-type speeds and LS bipolar power consumption. Using a new advanced "Schottky-coupled-logic" technique that combines low power Schottky circuitry on the same die as proprietary low power TRI-STATE ECL circuitry, the IDM2900 series of four-bit slice microprocessor components has been developed by National Semiconductor Corporation.

With this patented "SCL" technique, devices have been fabricated which are 30 to 50 percent faster than comparable 2900 designs now available. At the same time power consumption is slightly less than that for present LS bipolar designs and one third of that required for ECL-based designs.

The substantially increased system throughput made possible by this new series of SCL implemented IDM2900 parts means a number of advanced computer designs can be considered which were not possible before. For example, advanced "pipeline prediction" techniques in microprogram control design can be used to significantly reduce microcycle times.

An interesting byproduct of this approach is that this is the first ECL-based four-bit slice family to meet the military requirements over the military temperature range. Indeed, the new series shows even less performance degradation over the military temperature range than some of the standard LS bipolar parts now available.

A 60 Nanosecond Slice

The process and circuit improvement that have been achieved are the most apparent in the IDM2901A, which boasts an average microcycle time of only 60 to 70 nanoseconds, a 100% improvement over existing LS bipolar designs. Power consumption, however, is about the same, only 800 milliwatts for the entire device. Also available is an even faster version — the IDM2901A-1 — with a microcycle time of only 50 to 60 ns, and no increase in power consumption.

As with other implementations of the 2900 architecture, the IDM2901A is the key element in this high speed family of four-bit slice components. Designed as a high speed cascadable element intended for use in CPUs, peripheral controllers, programmable microprocessors and numerous other applications, the IDM2901A consists of a 16-word by 4-bit two-port random access memory, a high speed arithmetic logic unit and the associated shifting, decoding, and multiplexing circuitry. (See figure 1.)

Indeed, except for that most important parameter — speed — the IDM2901A is plug compatible with any LS bipolar implementation of the same architecture now on the market. But plug in replacement and raw speed improvements are just part of the story. As can be seen from tables 1 and 2, the IDM2901A, for example, has improved significantly almost every timing parameter possible. The read/modify/write cycle is 42 percent less, the maximum clock frequency 68 percent greater. Execution time for a typical operation, such as an add and shift (multiply) is 95ns maximum and 60ns typical, a significant gain over previous 2900 implementations. (See table 3.) Used in a typical design, system microcycle time is in the 100 to 150ns range, about one half to two thirds that of previous LS bit slice implementations.

These circuit and process improvements have been implemented in many of the standard components needed to build a system based on the 2900 bit slice architecture. In addition to the IDM2901A, 18 other standard parts have already been introduced. These will allow system designers to take advantage of the increased speed. (See table 4.)

©IC MASTER 1979

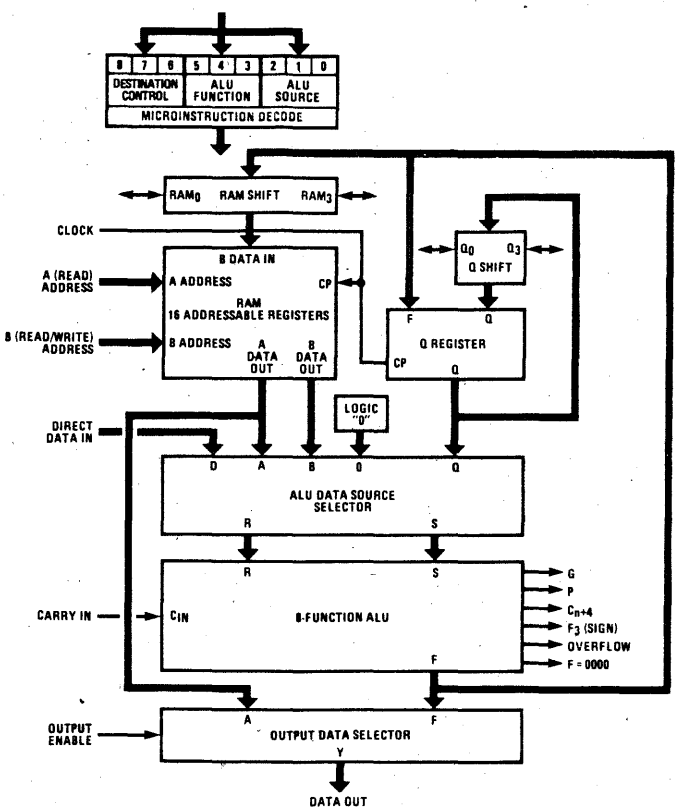

Figure 1. Block Diagram

Using some of the standard parts in the IDM2900 family, a typical 16-bit controller function can be implemented with a system microcycle time of about 140ns. This represents about a 30 percent improvement over that achieved with LS bipolar devices. Using the high speed IDM2901A-1, system throughput can be reduced to about 120ns. Using the proprietary parts added to the family, the same functions can be done in even less time, about 120 and 100ns, respectively.

Figure 2 shows a very simple, very fast state sequencing controller designed using IDM2900 family parts. It has no arithmetic capability, but 80ns clock intervals can be used. A less complex controller is shown in figure 3. It utilizes the IDM2901A for its data storage and arithmetic or logic generation. The IDM2911A is used as the state sequencer for this controller since its speed and subroutine stack can be used to advantage in the application.

LS + ECL = SCL

To achieve this combination of ECL speeds and LS bipolar power consumption, several techniques are used. One is to use low power Schottky circuitry in the periphery of the chip for input/output and interfacing to external TTL levels and the ECL internally — a technique commonly used in some bipolar memories. (See figure 4.)

Traditionally, ECL to TTL translators are slow unless considerable power is applied. In the IDM2900 family, however, the ECL speeds are retained, but at no cost in additional power, thanks to a TRI-STATE translator circuit technique that transforms the 0.7 volt ECL levels to 5 volt Schottky levels. This technique eliminates the slow and power consuming buffer transistors that usually do the job, and the translators can drop off to one third their active power with no loss in speed. Using this TRI-STATE translator technique, the extra 60 to 65 percent in power that would have been consumed is pumped instead into the portions of the device that require it; specifically, the ECL core circuitry.

*2901A-1 in parentheses.

The output translators use both linear and digital techniques. Differential ECL signals are translated using a differential current amplifier where the differential output voltage is changed to a differential current and then back to an output voltage. This drives a phase splitting transistor used to, in turn, drive the output circuitry in the periphery. Key to the operation of these translators is the use of an improved TRI-STATE logic buffer circuit characterized by a current mirror transistor having its base and emitter, respectively, connected to the base and emitter of the phase splitter transistor, and its collector connected to the voltage supply terminal. (See figure 5.) The emitter size on the current mirror transistor is about twice that of the emitter size of the phase splitter transistor.

The current mirror transistor supplements the drive current that is provided by the phase splitter transistor to the pull-down output transistor. This permits a higher resistance to be connected between the voltage supply terminal and the collector of the phase splitter transistor without diminishing the drive current to the pull-down output transistor. By connecting a higher resistance, the power for the circuit is reduced when the output is in its disabled state.

An additional advantage realized as a result of the current mirror transistor base and emitter connected, respectively, to the base and emitter of the phase splitter, and its collector to the supply voltage terminal, is a faster dynamic response in the conduction state of the pull-down output transistor to a change in the level of the digital data input signal. This occurs due to the selective use of the Miller feedback effect to cause a beneficial ratio change in the current mirror pair during a dynamic transition. Miller feedback occurs on the phase splitter transistor because its collector is coupled to the voltage supply through a resistance, and is absent on the current mirror transistor because its collector is directly connected to the voltage supply terminal. As a result, with the onset of the transition in the digital data input signal, as received from the collector of the input transistor, the current ratio between the current mirror and phase splitter transistors is even greater than the ratio of the respective emitter sizes.

Internally, the ECL logic has level translators on each input. This necessary circuitry achieves not only the level translation, but also has a very desirable input level sensitivity. As can be seen in figure 6, the translator is similar to a differential amplifier whose internal reference is stable. The result is very abrupt transfer characteristics on all input signals, and, thus, very fast switching speeds.

Improved Computer Design

The substantially increased system throughput made possible by this new series of SCL-implemented IDM2900 components means a number of improved bit slice processor designs can be considered which were not possible before.

Compared to simple control applications, there are a number of other factors to be considered when using IDM2900 series devices in more complex processor systems. The general changes which take place relate to special handling of data and address outputs and data inputs. The IDM2901A's register and ALU elements are no longer sufficient, especially when data and address word lengths grow from 8 to 16 bits or greater. Special functional elements are generally added, and include: input and output data or addressing registers, sign extend of

©IC MASTER 1979

data, and instruction decode, as well as shift and rotate control, and multiply functions. Also, special processor status registers are quite often added, as well as the unique controls for these elements.

Some special thought applied to these areas can reduce the parts count considerably and improve processor performance when using IDM2900 components.

The sign extend function is a good example of what can be done. Sign extension of a data word can be accomplished in a number of ways. But what the designer of the processor would prefer is to implement the function with the fewest possible parts and at the fastest data inputs. The first solution that comes to mind is the use of multiplexers, as shown in figure 7, which allows data to be fed through the multiplexer to D inputs of the IDM2901As. The control function which steers the data to the D input representing the bit which needs to be extended normally comes from the microprogram store. The added delay using this path is 12ns or more if parts slower than the DM74S157 are used. For each 4 bits of data to be modified an additional component is required; 2 parts for 8 bits, 3 parts for 12 bits and 4 parts for 16 bits.

The IDM2900 family, however, allows consideration of a number of other ways to do sign extension that require fewer parts and are less expensive and faster.

One is to use the carry input to accomplish a sign extend. But to use this input one must subtract "1" from "0" conditionally if the sign bit is a "1" and the opposite if it is a "0." But the problem arises as to how to obtain a value "0" in a register, an impossibility.

But the same effect can be achieved if the same address location is placed upon both the A and B address inputs. The source code is then used to select A and B and the function code for subtract. Now, if a carry input is a "1" the result is a "0" and if the carry input is a "0" the result is an all "1s" sign extend result. This technique can propagate for as many packages as necessary since the carry logic is necessary for other functions and is already included.

An easy method of inserting the conditional carry with the IDM2901A is to use the IDM2902 in a manner that is different from standard LS bipolar designs. Instead of connecting the carry input of the 2902 to the microcontrol carry from ROM, it is connected to the carry out of the least significant IDM2901A package. Note that this is just as fast as the previously suggested connections since the G and P are only slightly faster than the carry out of the least significant IDM2901A. Doing this allows one free G and P input to be available at the second level, as indicated in figure 8.

It is only necessary to connect an AND gate to the input and sign extend is accomplished. The lower bits which want to be entered without modification need only be applied to the D inputs and a source code selected to perform a D minus 0 transferred to B. The most significant package group produces A minus B where A and B are as described before. An all-1s or all-0s result is obtained dependent upon the value of the data bit to be extended. The result is a sign extension with three fourths of a package for any sign extend, achieved at no loss in normal cycle time. This is because a carry input change can occur later in a cycle than a change of D.

Performing a Multiply

Most of the time the name of the game in computer processor design is speed. Nowhere is this more true than when it is necessary to perform a multiply. This is because the multiply determines the longest cycle time if performed in the normal manner. This is because more than one path through the 2901A is utilized. Passage through several external components is usually required and this must also be added to the solution time. However, with the use of high speed components in the IDM2900 family it is possible to circumvent and shorten this path, and thus shorten the multiply cycle time.

How this is done is clearly understood only by referring to a specific example. Let's assume the problem is to perform a multiply of two signed 16-bit values.

Table 4. The 2900 Family

IDM2901A	4-Bit Microprocessor Slice
IDM2901A-1	4-Bit Microprocessor Slice

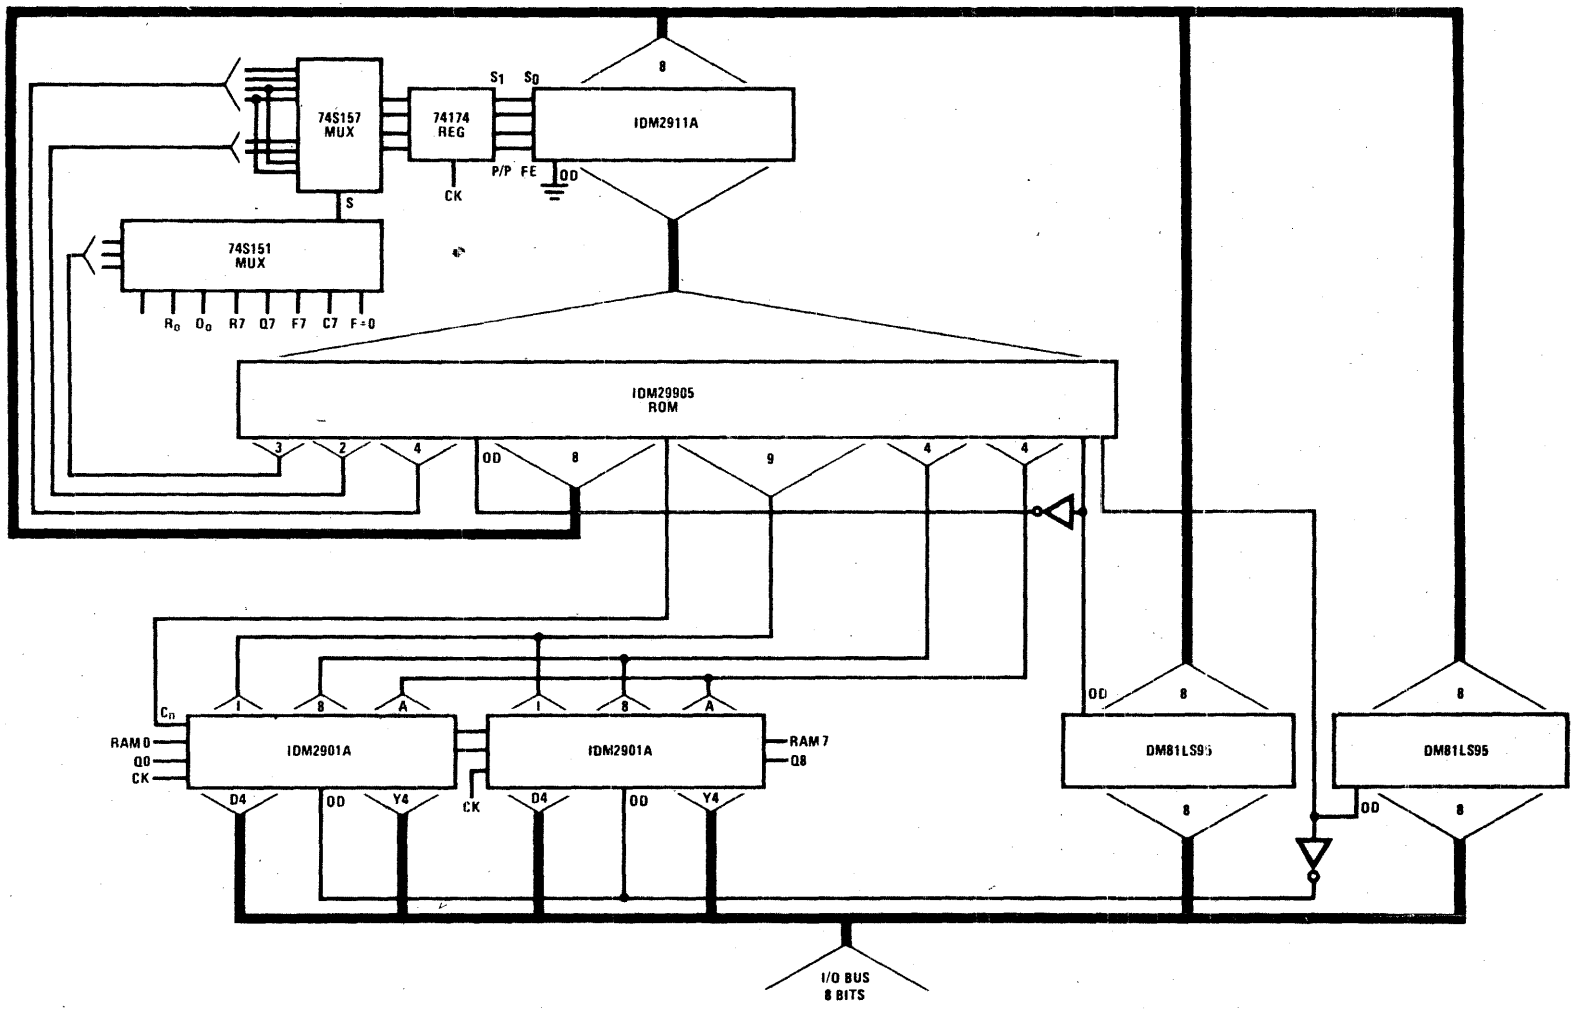

Figure 2. Very Fast State Sequencing Controller

©IC MASTER 1979

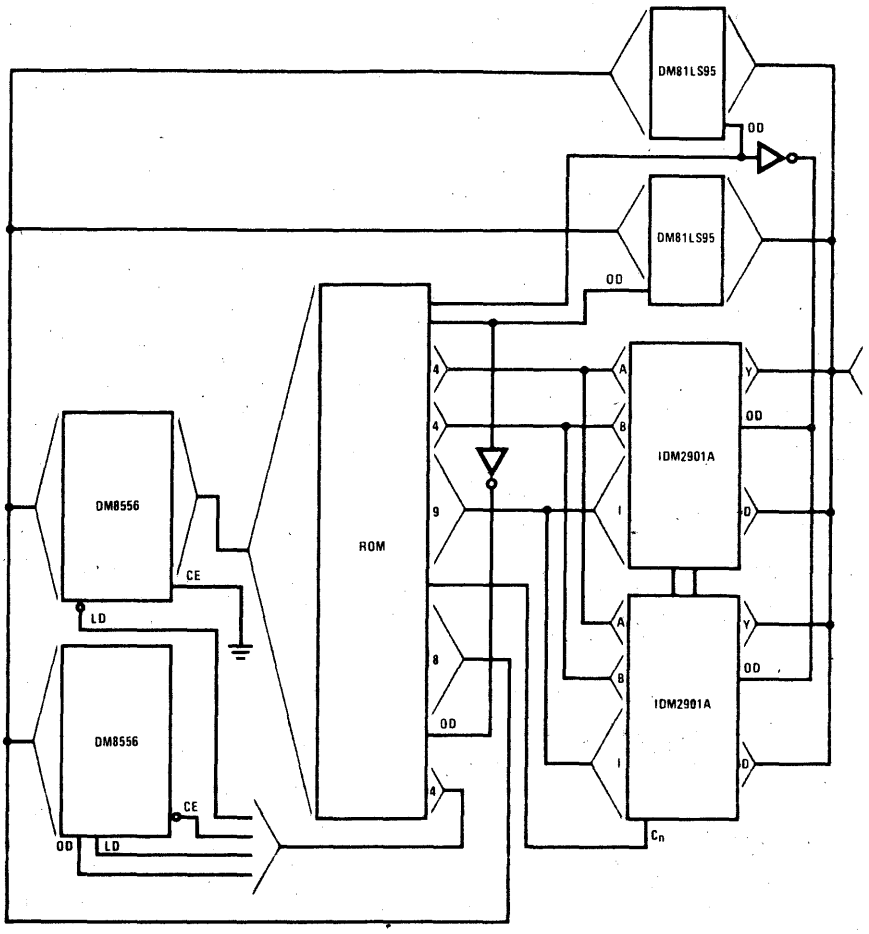

Figure 3. Small High Speed 8-Bit Controller with One Level of Subroutine Capability. This solution can run at 100ns cycles.

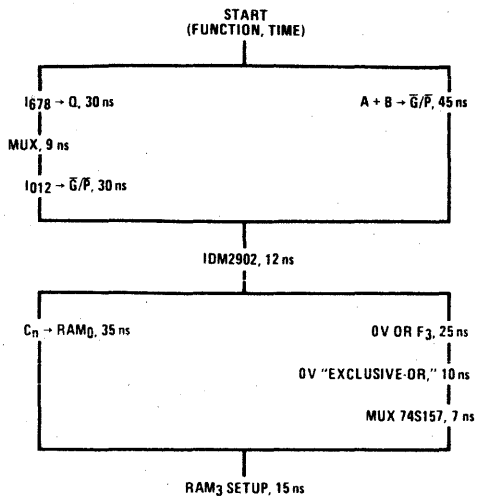
Figure 8 is the circuit as implemented using IDM2900 devices with the two multiplexers (74S253) and a D flip-flop (74S74). Using IDM2900 components and this technique, the multiply is performed 30 to 70 nanoseconds faster per cycle than with standard LS bipolar bit slice parts. This is a total speed improvement of 480 to 1,120ns.

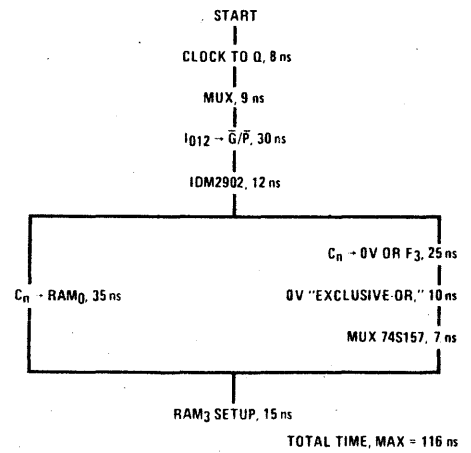
An additional significance to the design is that special multiply cycle time intervals are not required. This operation, therefore, makes possible a processor or controller with a less complicated clock control circuit.

Note that in figure 8 there is an extra stage of register storage in the Q register (D type flip-flop), compared to traditional designs. It is therefore necessary to shift Q one time without shifting the file register.



Since it is necessary to clear the partial product register, the Q register is shifted the first time so as to get the least significant bit into the extra storage location.

After this, the A and B register file addresses do not change and therefore do not enter into the timing equations. The much faster response time of an added D flip-flop saves a great deal of time in each microcycle of the multiply add and shift operation.



Since the A and B inputs do not change the critical path is from the D register output into the I_{O12} inputs and through the IDM2901As in a normal add and shift operation. Using the Q flip-flop, 20ns is saved, and using the I_{O12} input, 10ns is saved in each of the 16 cycles of the 16-by-16 multiply. This is all that is necessary for a positive signed multiplicand. But if a negative result is required, an additional path must be added.

The two possible paths in the most significant IDM2901A package are from C_n to RAM_0 output or from C_n to Overflow or F_3 and through the additional exclusive-OR gate and multiplexer input to the RAM_3 input. The maximum time delay path is 20ns from overflow and F_3 outputs back to the RAM_3 input for the most significant 2901A package.

Using standard techniques common to previous 2900 designs, only 15 conditional adds, followed by a shift and one conditional subtract and then a shift, are required to do a signed multiply in 2s complement notation. The resultant data paths required for this solution are as follows:

But if the circuit described in figure 8 is used, and the A and B address lines are set up one cycle ahead of the multiply sequence, the following timing comparison, using IDM2901A-1s instead of IDM2901As, prevails:

A net savings of 22ns per microcycle is thus achieved with this change. It can now be seen that sometimes it pays to add a flip-flop in certain locations to achieve higher performance so as to achieve a simpler solution in other areas. Here, a 20 percent reduction in cycle time was achieved.

Improving Microcycle Times with Pipeline Prediction

Perhaps the most important aspect of National's IDM2900 family of high speed, low power SCL components is the impact on how microprogram state sequencing is implemented in bit slice designs. The ultimate result will be further improvements in microcycle times beyond anything now possible with present 2900 bit slice families.

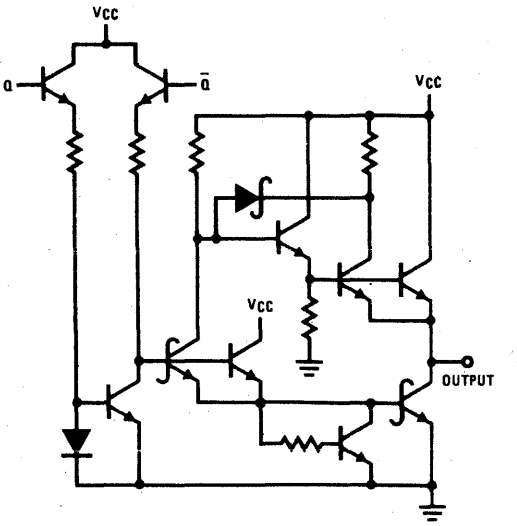


Figure 4.

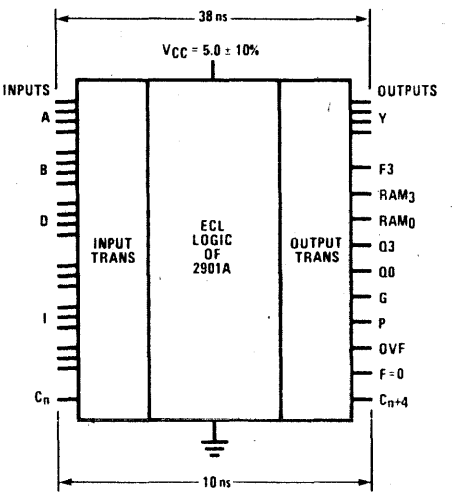

Figure 5.

In the very earliest use of state sequencing — in minicomputers and larger systems — operations were performed in series, one after the other, and the microcycle was defined as the sum of the operations. (See figure 9.) Still in use in some designs today, in this approach a state sequencer increments to the next state or branches to a next state depending on the logic level of the test input. In this solution the controller timing is from the clock edge of the controller register/counter through microcontrol storage (ROM) and the processing elements (2901s), then back through the next state decision tree to the controller-register counter.

The second approach is called "pipeline microcoding," and is an approach commonly used in bit slice systems such as the standard LS bipolar 2900 family. (See figure 10.) In this solution the microcontroller loop timing is operating in parallel with the execution of the processing component section.

©IC MASTER 1979

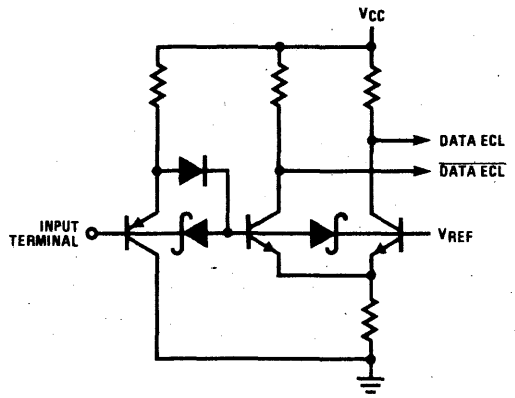

Figure 6.

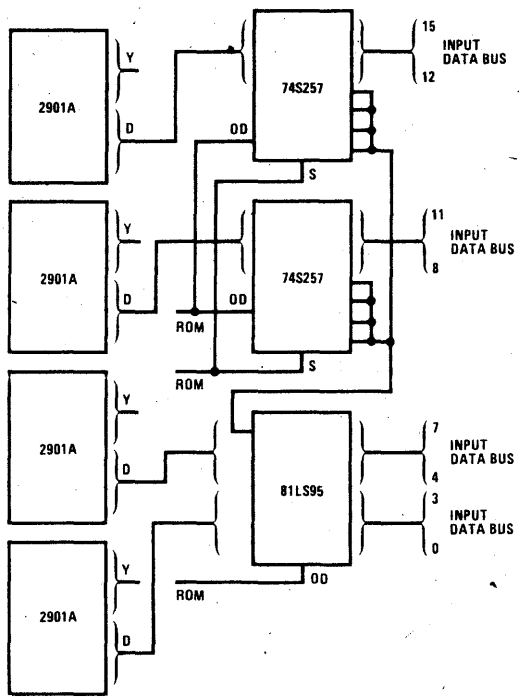

Figure 7. Sign Extend Using Multiplexers

During the time an arithmetic operation is being performed, the next microcontrol word is being set up for use by the microcode. The microcode for the present register/ALU operation occurs during the previous operation. The use of the register between the output of the microcontrol store and the 2901s allows the two sections to function with overlapped timing. The result of this type of micro-sequence control is a faster machine cycle time than used in the totally serial mode of operation.

Also required in this mode of operation is the absolute knowledge of the next state control one cycle before the execution of the 2901A cycle. It is therefore difficult to implement a number of successive conditional next state decisions. This type of microcontroller is said to be operating in a "pipeline" mode in that the next state microcontrol is being obtained during the time the previous one is being executed.

Using SCL-implemented IDM2900 components instead of LS bipolar bit slice devices in this approach results in a 65 to 75 percent reduction in the register/ALU portion of the microcycle. In spite of this, total microcycle time may be reduced only 40 to 50 percent. This is because the microcycle time is determined by the length of the longest operation, which in this case can be the delay in the microcode portion.

To get the full benefit of the high speeds inherent in National's SCL family therefore means abandoning the traditional approach to pipelining used in previous 2900 bit slice designs. What can be used instead is a different technique — pipeline prediction — which allows a reduction in the microcode portion of the microcycle so that it is equal to or less than the register/ALU setup time. The relative timing comparisons between these four approaches are shown in figures 11A through 11D.

The "pipeline prediction" controller functions in much the same way as the standard pipeline configuration except that it can also accept any number of successive conditional next state decisions in a row. This microcontroller "pipelines" microcontrol sequences in much the same manner as the previous design and for the same reasons. But shorter microcycles can be obtained due to the fact that during any microcycle the most predictable next cycle is being set up. But should the test of the next state decision be different from the one predicted, then the alternate state is conditioned and the microcontroller and the data system pass through a correction interval.

This design makes next state decisions within the same cycle as microcontrol of the IDM2901A. Figure 12 shows a "pipeline prediction" technique where the next state is a choice between two states. This means one state is predicted, and if incorrect the second choice is used. The microcycle is either delayed or an additional cycle is inserted.

There is no real reason why the design must be limited only to two next state conditons. Any number may exist. It is only necessary to predict the most probable next state and correct it if necessary. Most next state decisions are known to a high probability of occurrence. The additional cycle time added for the few times an incorrect prediction is made is extremely small compared to the total microcycle time saved. Additional speed is obtained with this technique since it minimizes the number of states through a control sequence.

Finally, pipeline prediction requires no increase in the number of components to achieve these increases.

Simplify CRT Terminal Design with the DP8350

National Semiconductor
Application Note 198
Helge H. Mortensen
March 1978

INTRODUCTION

This application note is a description of a "low cost" CRT data terminal card design, based upon National's CRT Controller (DP8350) and 8-bit N-channel microprocessor (SC/MP). The terminal has a minimum parts count and implements all TTY functions. Even with this minimum number of parts, the terminal provides some "smart" features by efficiently utilizing the available hardware. Screen scroll, RS-232C interface and adjustable baud-rate (up to 1200-baud) are featured on the card. Higher baud-rates are available on a word-by-word basis if the RS-232-handshake signal is used. The design also demonstrates use of 2 new microprocessor-interface parts: the Asynchronous Communications Element (ACE), for serial I/O; and the RAM Input/Output (RAM I/O), for keyboard scanning and scratch pad memory. A 2-kilobyte video RAM is implemented with four 1024 x 4-bit, static RAM chips (MM2114), and dot generation uses the DM8678 5 x 7 Character Generator.

The card is self-contained except for the CRT monitor and power supply. It holds a keyboard and monitor-interface circuitry. Monitors requiring separate video and sync signals (Ball Brothers), and those requiring composite video (Motorola) are accommodated.

System Architecture

Since system cost is typically somewhat proportional to parts count, arriving at a minimum parts count solution has been a goal throughout this design effort.

A full-blown CRT terminal is shown in *Figure 1* and its low cost counterpart in *Figure 2*. Address decoding details are omitted in both cases.

Removing overhead circuitry shown in *Figure 1*, and making use of the TRI-STATE® concept greatly facilitated the parts reduction effort.

Obviously, extreme time conflicts for communicating on the system busses are created because all essential parts require access. Let us investigate this problem a little further.

Because the CRT Controller does the CRT display refresh function, it must have access to a memory containing current data for display. This memory may be a shift register (octal, 80-bit line buffer in *Figure 1*) which is loaded at the first video line in a character row and then recirculated for the number of video lines in that character row. Using such a line buffer allows the microprocessor access to the system busses for more than 90% of the video time (screen time). On the other hand, by removing the buffer, the refresh circuit needs direct memory access (DMA) during video display time.

However, with the bidirectional data buffer and the TRI-STATE address buffer in the system, the situation is not yet too serious. (We are only preventing the SC/MP microprocessor from updating video RAM data or using the scratch pad during character display time.) Instruction fetch (ROM) and keyboard scanning are still not affected. However, with the saving of the data buffer and the address buffer, a well-organized "time share" of the busses is required. How does this limited bus access affect the time-critical features such as scroll and high baud rate?

Scroll

Several scrolling methods may be implemented with the CRT Controller. The most straightforward is a rewrite of memory. This requires long processing time and bus access and is not feasible with the minimum hardware indicated in *Figure 2*. Sensing when the CRT is scanning character-row 24 and then loading a new "row start" requires additional overhead circuitry. An alternative approach is to load a new "top of page" address for each scroll and have the video RAM "wrapped-around" when it is accessed by the CRT!

In the latter approach, the processor only has to clear a row in video RAM and load a register in the CRT Controller to perform a total-screen scroll. The only problem remaining is handling the location of the scratch pad in the video RAM address space. By using the RAM I/O chip for a keyboard scanning and scratch pad RAM, the problem is solved. An additional feature for the software programmer is that the keyboard and RAM are addressable within the reach of one 8-bit index register.

Maximizing Communication Baud Rate

Assuming that the processor has bus access only during the vertical blanking period and the ACE interrupt service subroutine is executed in less than this time, only one received data word could be processed per frame! The processor's task is to transfer the word from ACE to scratch pad memory, check for terminal or system control functions, write into the proper locations in video RAM and check the keyboard for "Break" (BRK). A quick calculation reveals 60 bits/second as the maximum baud rate! To improve communication speed, the processor must have bus access during the video frame scan time. Three of the 10 scan lines making up a character row are blanked except during cursor time. Using these three lines (minimum decoding required) for processor bus access during video time allows us to communicate at 1200 baud.

Note that the baud rate is limited by the frame rate in the first approach; in the second approach, the limitation is the real time required to execute the service routine. The calculation is performed as follows. Estimated execution time for service routine with 100% availability of the bus is 2 ms. However, bus access is only granted during 3 video lines in each character row which is worth 192 μs. In terms of video time, we need 10 character rows to finish the routine and be ready for the next interrupt. Display time for 10 character rows is 6.4 ms, which in turn is the time interval for one 10-bit word. This translates into a 1600-baud maximum capability if scroll is not included in the service routine.

Address Decoding

Holding parts to a minimum leads to a one ROM address decoding scheme. However, this does not coincide with minimum cost. Instead, 2 low-power Schottky MSI devices replace the ROM in the final design.

Memory Address Space Utilization

A very simple decoding scheme is facilitated by partitioning the processor memory space into 500-byte pages. The detailed memory map is shown in *Figure 3*. In addition, address bits 12 and 13 (multiplexed on the data bus), are used to map four 4-kilobyte pages, with the first page dedicated to processor peripherals and the following 3 pages dedicated to register loading of the CRT Controller. The 3 CRT Controller registers to be loaded are "top of page", "row start" and "cursor".

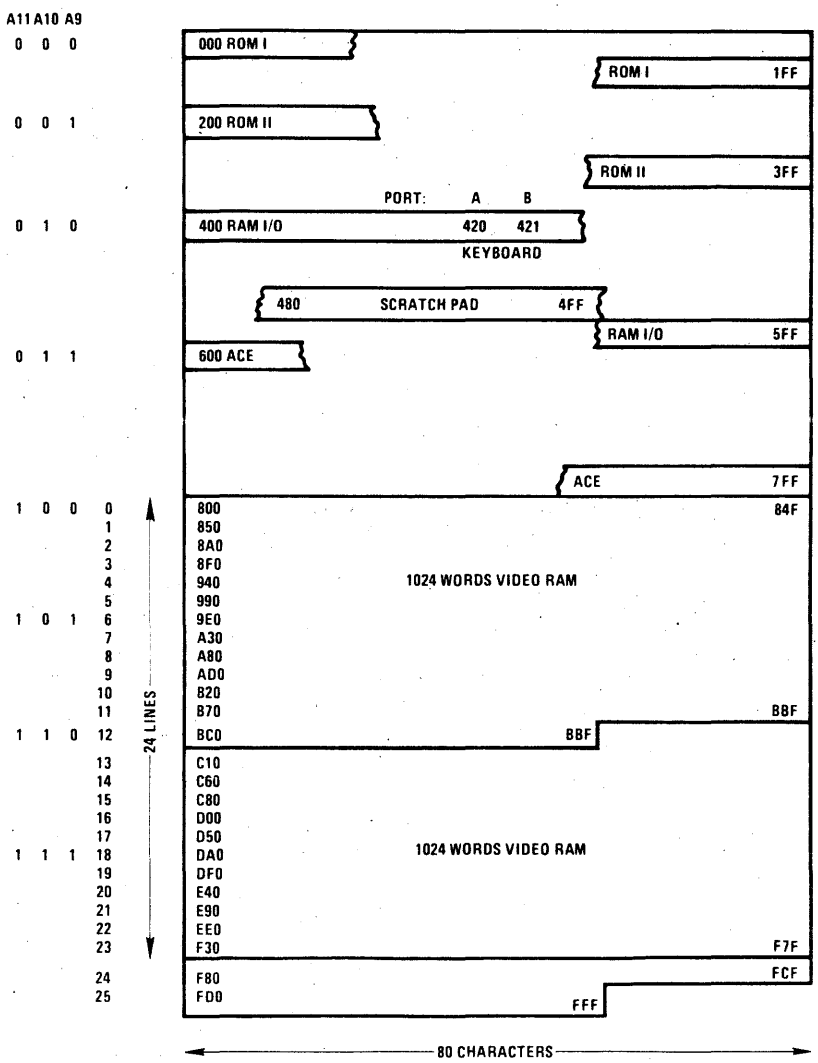

FIGURE 3. Memory Map

DISCUSSION OF SPECIFICATIONS

A device used to communicate with a computer is called interactive if it has the following properties:

a. Data may be entered on a keyboard and sent to the computer, which in turn echoes it back to the display.

b. Data may be received from the computer and displayed; keyboard is scanned for "Break" (BRK) entry by the operator of the system.

The concept of an interactive terminal is illustrated by the block diagram shown in *Figure 4*. To understand this, follow the data from the keyboard to the display and list the specifications for each block. An overall terminal specification is depicted in Table I.

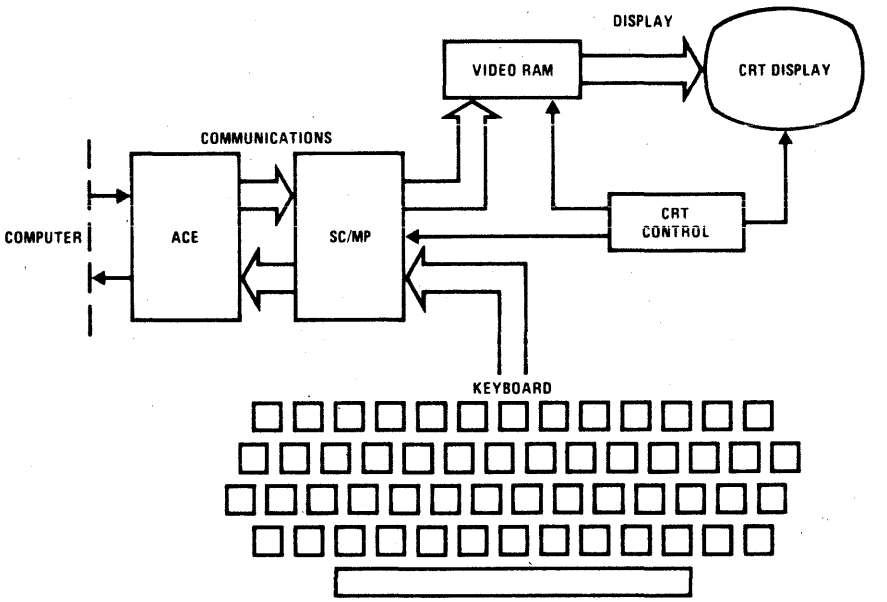

FIGURE 4. Block Diagram of an Interactive Terminal

TABLE I. TERMINAL SPECIFICATIONS

Keyboard	
Style	Typewriter
Characters/code set	64/ASC II
Cursor controls	6
Keyboard encoder	Software
Communication	
Mode	Full duplex, half duplex option
Technique	Asynchronous
Communications protocol	ASC II
Code	ASC II
Bits/character	10/11
Speed, bits/second	110 to 1200 (19,200 word-by-word)
Operator selectable speeds	4
Format	Character
Terminal interface	RS-232, 20 mA current loop
Display	
Display positions, characters/display	1920
Display arrangement (line x characters)	24 x 80
Total display symbols	64
Symbol formation	5 x 7 dot matrix
Reverse video	Cursor and whole screen
Scrolling	Yes
Cursor type	Block, reverse video
Cursor position	Down, left, right, home and return, back space.

Keyboard

The keyboard is a copy of a standard teletypewriter with two-key rollover. The 54 keys can be broken into alphanumeric, punctuation, symbols, cursor control, and system control keys. The processor scans the keys at all times and translates any key closure into a unique code (ASC II), which is sent to the input/output channel for serial transmission to the computer. It should be noted that the RAM I/O chip has the capability of scanning 64 keys (8 x 8).

Communications

The input/output channel is based upon the Asynchronous Communication Element (ACE). This integrated circuit performs parallel-to-serial conversion of the data received from the keyboard, and serial-to-parallel conversion of data sent from the computer for display on the screen. When the system is initiated (power-up), the on-chip programmable baud generator is loaded with the desired baud rate (switch selectable). Start, stop, and parity bits are appended or deleted in this block of the system, depending on the direction of data flow. All control signals for the standard RS-232C interface are likewise generated here. Standard electrical specifications for RS-232C and 20 mA current loop are met by adding dedicated interface parts.

Display

After the data is received from the computer, it is stored in the video RAM. The CRT Controller chip refreshes the display at 60 Hz by sequentially addressing the video RAM; 1920 addresses are generated to fetch data for 24 lines of 80 characters. The standard 64-character ASC II set is displayed using a 5 x 7 dot-matrix block for each character. Data is entered from left to right and from top to bottom, until the screen is full. After that, upward scrolling with top-line overflow and newly cleared bottom line takes place automatically with line feed.

Software

A detailed flow chart of the software is shown in *Figure 5*. It is set up to service 3 major functions: a) initialize the system; b) scan the keyboard and c) service the ACE upon interrupt request.

a. Initialization
   The video RAM is cleared and the cursor is loaded at the upper left corner of the screen. ACE is set up with the desired baud rate and the interrupt enable flag is armed.

b. Keyboard Scan
   The keyboard is first checked for "Any Key Down" status. If positive, the keyboard is scanned and the binary code (ASC II) is computed by the program and read to ACE.

c. ACE Interrupt Service Routine
   When its receiver buffer is full, the ACE puts out an interrupt request. The SC/MP immediately suspends keyboard scanning and reads the buffer register. The main portion of this routine is checking incoming data for control functions and updating the video RAM and the CRT Controller registers. It should be noted that the need for executing this routine is the limiting factor for high baud rate communications.

Hardware

The detailed hardware implementation is shown in *Figure 6*. The CRT Controller grants the SC/MP microprocessor bus access during blanked scanlines and vertical blanking interval by logically OR-ing line counter outputs with the vertical blanking pulse and using this signal as a bus-available signal. The CRT Controller is held off the bus by disabling the TRI-STATE address output. This is done by applying logical "0" to the RAM address enable pin of the CRT Controller, the SC/MP then takes the bus as needed.

Sense-A of SC/MP is used as an interrupt request input whenever received data is available in the receiver buffer register of the ACE. The interrupt service routine is executed during vertical blanking and "inactive" video time as indicated above.

The keyboard is sensed for "Any Key Down" (under program control) by reading Port-B of the RAM I/O chip. Upon a positive result, the keys are scanned by a special sequence for key identification and encoding.

Mechanical

A PC board layout and its assembly is shown in *Figure 7*. Note that the keyboard is mounted directly on the card.

Acknowledgment

The development of the terminal involved significant contribution by a large number of people. The author would particularly like to express his appreciation to Len Bryson for software development and Dana Knight for invaluable suggestions and ideas during the hardware design phase.

INTRODUCTION TO DIGITAL

The Master Selection Guide provides sufficient information to make initial product selections. It enables you to find the products which are most appropriate to fulfill your major requirements and then provides data for many of the more important products.

All devices that appear in this section, both in the initial selection guide and in the data pages, are included in all other indexes.

The first two pages of the digital section present comparisons of the performance of the major digital families to help you choose between families. These are followed by lists of the devices in each family arranged into functional groups (arithmetic, buffers/inverters, etc.). The initial selection lists are followed by the device data pages which have been provided for you by the manufacturers. When such data is in the book, the page numbers are given with the initial selection listings.

Some digital circuits — calculator, watch chips, and electronic organ circuits — are not included in this section, but are covered in detail in the Linear-Consumer section. Digital circuits which do not fall into one of the major logic families are listed at the end of the selection information under the heading Digital-Other Devices.

This section is not complicated by reference to package styles; the package style suffixes are usually deleted. For more information on each companies' suffixes, see the Part Number Guide. Throughout the Master Selection Guide, each full military temperature range (−55°C to 125°C) device is indicated by a dagger (†) before the manufacturer's name. Manufacturers' names are normally spelled out; however, a few are abbreviated and the abbreviations are explained on page 306.

WHICH DIGITAL FAMILY?

Edited from material published in Fairchild Progress magazine, Peter Alfke, author.

With several digital families available, the logical question is — which are the best ICs for my particular application?

To answer the question, you need to evaluate the pros and cons of the various logic families. These tradeoffs are listed in Tables I-IV. You will need to establish your speed requirements. Since speeds are characterized by the clock rate of registers and counters, this discussion is divided into four groups based on clock rates.

Very High Speed	Clock Rate	> 100 MHz	ECL
High Speed	Clock Rate	30 to 100 MHz	ECL, S-TTL
Medium Speed	Clock Rate	5 to 50 MHz	LS-TTL, TTL
Low Speed	Clock Rate	< 5 MHz	LS-TTL, CMOS

VERY HIGH SPEED SYSTEMS — Clock Rate > 100 MHz

There is only one reasonable IC logic family for use in very high speed systems — Emitter Coupled Logic, ECL. Originally, this technology presented considerable electrical problems such as voltage and temperature sensitivity and fast edge rates that caused reflection and cross-talk problems. In recent years, however, ECL development has become more user-oriented and there is better compatibility between circuit characteristics and interconnection techniques.

The modern popular ECL line is the 10,000 Series, manufactured in uncompensated, in voltage-compensated, or in both voltage and temperature-compensated forms. The latter form of compensation assures that significant parameters such as logic levels, noise margins and speed remain constant over a wide range of temperature and power supply voltage. These 10K and 95K logic circuits have deliberately slowed-down edge rates to make them easier to use and they can also drive terminated transmission lines whenever required by the interconnection length.

HIGH SPEED SYSTEMS — Clock Rate 30 to 100 MHz (Table II)

Here, you have a choice between ECL and Schottky TTL. H-TTL is really obsolete since it consumes more power than Schottky TTL, has similar interconnection problems and offers only half the speed. Also, it is not significantly faster than the best Low Power Schottky TTL. So, this narrows down your choice to ECL and Schottky TTL.

MEDIUM SPEED SYSTEMS — Clock Rate 5 to 50 MHz (Table III)

Standard TTL has been the obvious choice for medium speed systems for many years. Many designs will increasingly use Low Power Schottky TTL as it becomes more available, multiple sourced, and as the price premium decreases. You can mix standard and LS-TTL to solve most fan-out problems.

SLOW SPEED SYSTEMS — Clock Rate < 5 MHz (Table IV)

If you design slow speed systems you are faced with the largest number of attractive alternatives. Traditionally, TTL and DTL has been used. Now you can save power, cost and avoid heat and reliability problems by changing to LS-TTL, without affecting the logic design and perhaps not even changing the PC board layout.

If the system speed permits, you can switch to CMOS and save even more power and simplify the power supply, but now you must cope with a family of different logic elements and a hodgepodge of MSI elements, far less systems oriented than the better TTL circuits. Also you will notice wide parameter differences between the "same" products from different vendors.

The greatest challenge, however, is to examine the traditional hard-wired system design and decide whether or not it can be implemented with a microprocessor. If the requirements are both complicated and slow enough, this approach might save manufacturing cost, design time, and service time, as well as improve reliability, provide additional flexibility, and perhaps allow additional features at no extra cost.

MOS (p-channel, n-channel, either metal or silicon gate, also silicon on sapphire) does not compete directly with LS-TTL and CMOS. The MOS logic elements (gates and flip-flops) are very small but the input and output buffers are so large and relatively slow that MOS cannot be cost/performance competitive at MSI complexity (below 200 gates). MOS is therefore meaningful only in LSI circuits, where it has proven to be not only competitive, but dominating. These areas are:

- LSI memories, RAMs, ROMs, and shift registers of 500 to 4096 bits at clock rates below 5 MHz.
- Specialized, inherently slow LSI functions produced in very large volume (calculators, clocks, some instrument circuits like DVMs).
- Custom LSI circuits where the manufacturing volume is high enough or the weight/space saving valuable enough to absorb the development cost.
- Microprocessors, where a very carefully designed, standard circuit performs specialized tasks through ROM-stored programming.

SUMMARY

The proliferation of digital circuits and technologies gives you a new degree of freedom, but it also challenges your judgement and imagination. You are faced with an almost overwhelming number of competing technologies, each with its strong and weak points. The basic component speed requirement and the available power will quickly narrow your choice down to two or three different logic families; the tables presented here will make your final decision easier.

You should not forget, however, that the component speed requirement is also affected by your choice of architecture. A parallel approach requires more, but slower components, while a serial architecture requires fewer but faster components. The vesatility of modern MSI circuits makes it easy to explore these alternatives. It is very important to choose the IC logic family at an early stage in the system design, since the full cost, speed and reliability advantages can only be gained by designing in accordance with the device features, taking advantage of their logic and organization.

TABLE I: COMPARISON OF ELECTRICAL CHARACTERISTICS

	CMOS 5 V SUPPLY	CMOS 10 V SUPPLY	STANDARD TTL	74LS LOW POWER SCHOTTKY	9LS LOW POWER SCHOTTKY	SCHOTTKY TTL	10K ECL
PROPAGATION DELAY	35 ns	25 ns	10 ns	10 ns	5 ns	3 ns	2 ns
FLIP-FLOP TOGGLE FREQUENCY	5 MHz	10 MHz	35 MHz	40 MHz	80 MHz	100 MHz	200 MHz
QUIESCENT POWER[1]	10 nW	10 nW	10 mW	2 mW	2 mW	25 mW	25 mW
NOISE IMMUNITY	2 V	4 V	1 V	0.8 V	0.8 V	0.9 V	0.2 V
FAN OUT (within family)	$> 50^2$	$> 50^2$	10	20	20	10	> 50

[1]Note the change from nanowatts to milliwatts.
[2]Or as determined by allowable propagation delay.

TABLE II. COMPARISON OF DIGITAL LOGIC FAMILY CHARACTERISTICS FOR HIGH SPEED SYSTEMS (CLOCK RATE 30 TO 100 MHz)

10K AND 95K SERIES ECL	SCHOTTKY TTL
Advantages	**Disadvantages**
Short delays allow propagation through more logic levels in a clock cycle. Compatibility with even faster families currently in development makes future system upgrading easy.	Component delays are about twice as long as with ECL and will not be improved in the foreseeable future.
Low output impedance drives all types of interconnections including terminated transmission lines.	Outputs are not capable of driving terminated transmission lines without causing severe fan-out compromises.
High output drive capability and complementary outputs accommodate differential transmission over tested pairs.	
Slow edge rate minimizes reflection problems.	Has the fastest output transitions of any logic family, causing reflection problems even with relatively short interconnection lengths, and causing cross-talk problems.
Complementary outputs on many elements add design flexibility.	
Wired-OR capability simplifies logic design.	
Compensated circuits simplify power supply and temperature regulation.	Generates fast power supply load changes, requires good decoupling.
High input impedance minimizes loading, allows high fan-out.	Input thresholds and output low levels are slightly offset from conventional TTL, causing some loss of noise immunity.
Disadvantages	**Advantages**
Unfamiliar type of circuitry, logic, nomenclature, and pinouts.	Compatible with popular TTL, same supply voltage, almost identical signal levels, same SSI and MSI logic, nomenclature, pinouts. Ideal to speed up critical paths in standard TTL systems.
Not level-compatible with TTL and CMOS, requires additional interface elements.	
Requires external pull-down resistors on all used outputs.	Outputs require no pull-up (or down) resistors.
Has less absolute noise margin.	Large signal swing and large absolute noise immunity cause less problems with temperature or supply voltage variations and gradients, resistive drops along supply lines, and outside noise.
Higher ground current requires heavier distribution busses.	
Has one less logic pin per package due to double ground.	
Has higher power consumption at low frequencies than equivalent S-TTL circuits.	Has lower system power consumption at moderate speed.

TABLE III. COMPARISON OF DIGITAL LOGIC FAMILY CHARACTERISTICS FOR MEDIUM SPEED SYSTEMS (CLOCK RATE 5 TO 50 MHz)

STANDARD TTL	LOW POWER SCHOTTKY TTL
Advantages	**Disadvantages**
Large number of SSI and MSI functions.	Somewhat fewer devices but this is changing.
Low prices.	Presently higher priced than standard TTL.
Specifications standardized.	Electrical characteristics differ between suppliers.
Disadvantages	**Advantages**
High power consumption (10 mW per gate, 200 to 500 mW per MSI package.)	Saves 75% of the power of equivalent standard TTL.
Large, heavy, expensive, hot power supply and regulator.	Smaller, lighter, cheaper, cooler power supply and regulator.
Heat density problems when using predominantly MSI.	No heat density problem. Cooler, therefore more reliable.
	May eliminate the need for fans and filters.
Not fully compatible with most CMOS and MOS.	Compatible with CMOS and MOS.
	Generates less noise than standard TTL.

TABLE IV. COMPARISON OF DIGITAL LOGIC FAMILY CHARACTERISTICS FOR LOW SPEED SYSTEMS (CLOCK RATE 5 MHz)

STANDARD OR LOW POWER SCHOTTKY TTL	CMOS
Advantages	**Disadvantages**
Well designed, system-oriented MSI.	Some of the original CMOS circuits are poorly defined and not systems oriented.
Adequate speed, tight tolerances.	Low speed, delays depend on supply voltage and capacitive loading.
Low impedance outputs give good immunity against capacitively coupled noise.	Poor current noise immunity (capacitively coupled noise.)
Familiar functions, logic, pinouts.	New functions, logic pinouts.
Standard TTL available from many suppliers, low cost.	Large parameter variations between different vendors.
Disadvantages	**Advantages**
Relatively high static consumption and heat generation.	Extremely low static power consumption, very little heat generated at moderate speed.
Tight power supply voltage requirements (5 V ±5% commercial, ±10% military grade).	Very wide range of supply voltages (theoretically 3 . . . 20 V, practically 5 . . . 12 V).
Not well-suited for portable battery operation.	Ideally suited for battery operation.
More expensive power supply.	Low cost power supply. Less cost, weight, heat, size than for any other family.
Lower voltage noise immunity.	High voltage noise immunity, an advantage with inductively coupled noise.
LS-TTL available from only a few suppliers.	Available from many suppliers.

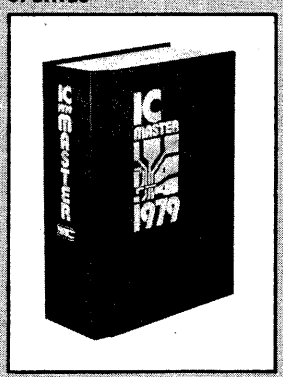
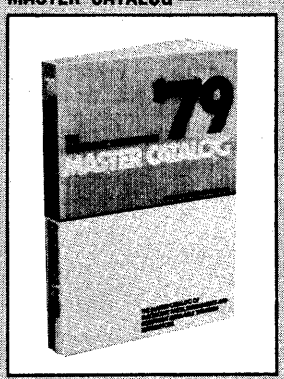
WE KNOW OUR STUFF



42 YEARS OF EXPERIENCE IN CATALOGING, 22 EDITIONS OF eem

eem/ELECTRONIC ENGINEERS MASTER CATALOG —



The "blue-ribbon" catalog/directory that has become "the standard of the industry" for electronic engineers, buyers and specifiers.

IC MASTER AND THE UPDATES —

The only complete single-source directory including all IC devices manufactured in the United States. Updated three times yearly with accumulative supplements.

ELECTRONIC DISTRIBUTORS MASTER CATALOG —

The only national catalog designed exclusively for distributors and their customers featuring electronic parts, instruments and equipment.

ELECTRONIC PRODUCTS MAGAZINE —

The products magazine . . . A 100% product-oriented magazine including hundreds of new products and special features every month.

eem FILE SYSTEM —

The only filing system designed especially for the electronics engineer. Instant retrieval and organization of data sheets and catalogs.

UTP CUSTOM CATALOGS —

The Cadillac of individualized catalogs for the electronic parts distributor, featuring solely his lines and services.

UNITED COST AND PRICING SERVICES —

The electronic distributors' proven method of being up to the minute on his cost and selling prices.

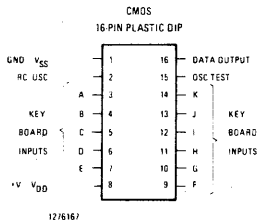
ENCODER/DECODER REMOTE-CONTROL 2-CHIP SET



Features

- ☐ Small Parts Count — No Crystals Required
- ☐ Easily Used in LED, Ultrasonic, RF, or Hard-wire Transmission Schemes
- ☐ Very Low Reception Error
- ☐ Low Power Drain CMOS Transmitter for Portable and Battery Operation
- ☐ 31 Commands — 5-bit Output Bus with Data Valid
- ☐ 3 Analog (LP Filterable PWM) Outputs
- ☐ Muting (Analog Output Kill/Restore)
- ☐ Indexing Output — 2½ Hz Pulse Train
- ☐ Toggle Output (On/Off)
- ☐ Mask-Programmable Codes

Pin Configuration S2600

Block Diagram S2601 Decoder

Pin Configuration S2601

Functional Description

The S2600/S2601 is a set of two LSI circuits which allows a complete system to be implemented for remote control of televisions, toys, security systems, industrial controls, etc. The choice of transmission medium is up to the user and can be ultrasonic, infrared radio frequency, or hardwire such as twisted pair or telephone.

The use of a synchronizing marker technique has eliminated the need for highly accurate frequencies generated by crystals. The S2600 Encoder typically generates a 40kHz carrier which it amplitude-modulates with a base-band message of 12 bits, each bit preceded by a synchronizing marker pulse.

Bits 1 and 12 denote sync and end-of-message, respectively, bits 2 thru 6 constitute a fixed preamble which must be received correctly for the command bits to be received, and bits 7 thru 11 contain the command data. The S2601 Decoder produces an output only after two complete, consecutive, identical, 12-bit transmissions. Marker pulses, preamble bits, and redundant transmissions, have given the S2600/S2601 system a very high immunity to noise, without a large number of discrete components.

S2600 Encoder

The S2600 is a CMOS device with an on-chip oscillator, 11 keyboard inputs, a keyboard encoder, a shift register, and some control logic. The oscillator requires only an external resistor and capacitor, and to conserve power, runs only during transmission. Keyboard inputs are active-low, and have internal pull-up resistors to V_{DD}. When one keyboard input from the group A thru E is activated with one from the group F thru K, the keyboard encoder generates a 5-bit code, as given in the table entitled ((S2600/S2601 CODING," below. This code is loaded into a shift register in parallel with the sync, preamble, and end bits, to form the 12-bit message.

The transmitter output is a 40 kHz square wave of 50% duty factor which has been pulse-code-modulated by (i.e., ANDed with) a signal having a recurring pattern, a bit frame of 3.2 millisecond duration. This bit frame is comprised of three signals: the Start signal which is 0.4 milliseconds of logic "1"; followed by the Data signal which is 1.2 milliseconds of the lowest-order shift register bit; followed by the Mark signal which is 1.6 milliseconds of logic "0" (except in the first bit frame where Mark = 1 to facilitate receiver synchronization).

The shift register is clocked once per bit frame, so that its 12-bit message is transmitted once in 38.4 milliseconds. The minimum number of tranmissions that can occur is two, but if the keyboard inputs are active after the first 3.6 milliseconds of any 12-bit transmission, one more 12-bit transmission will result. Transmissions are always complete, never truncated, regardless of the keyboard inputs.

The Test Input is used for functional testing of the device. A low level input will cause the oscillator frequency to be gated to the Data Output pin. This input has an internal pull-up resistor to V_{DD}.

S2601 Decoder

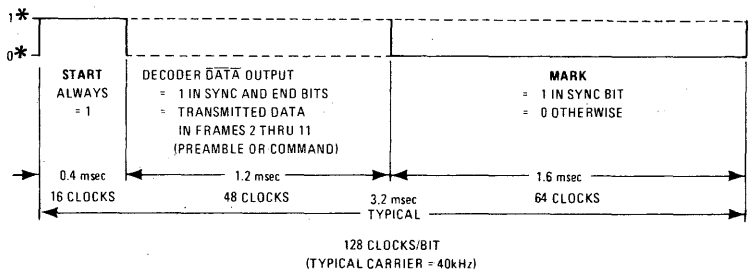
The S2601 is a PMOS LSI device with an on-chip oscillator, five keyboard inputs, a 40 kHz signal input, and 11 outputs. The oscillator requires only an external R and C. The five keyboard inputs are active-low with internal pull-up resistors to V_{SS}; activation of any two causes one of 10 possible 5-bit codes to be generated and fed to the outputs of the S2601, overriding any 40 kHz signal input.

Two counters, the signal counter and the local counter, are clocked respectively by the signal input and a 40 kHz signal from the local RC oscillator timing chain. A 40 kHz input lasting 3.2 milliseconds (i.e., an initial bit frame) causes the signal counter to overrun and reset both itself and the local counter. At specific intervals thereafter, the local counter generates pulses used to interrogate the contents of the signal counter. Resynchronization of the counters occurs every bit frame so that the interrogation yields valid data bits even if the transmitter oscillator frequency has deviated up to ± 24% with respect to the receiver oscillator frequency.

Decoded data bits from the next five bit frames following the initial synchronizing frame are compared with the fixed preamble code. The next five decoded bits, the command bits, are converted to a parallel format and are compared against the command bits saved from the prior transmission. If they match, and if the preamble bits are correct, the command bits are gated to the receiver outputs. However, a mismatch causes the receiver outputs to be immediately disabled, and the new command bits are saved for comparison against the command bits from the next 12-bit transmission. In the case where 2 identical, proper, 12-bit transmissions are immediately followed either by transmissions with erroneous preamble codes or by

©IC MASTER 1979

nothing, the receiver outputs will be activated during the end-frame of the second transmission, and will be disabled 45 milliseconds thereafter. In the rest (disabled) state the five Binary Outputs are at a "1" logic level; when not in the rest state, one or more of the open-sourced output transistors will conduct to V_{DD}. The Data Valid output is low during the rest state, and high whenever data is present at the Binary Outputs.

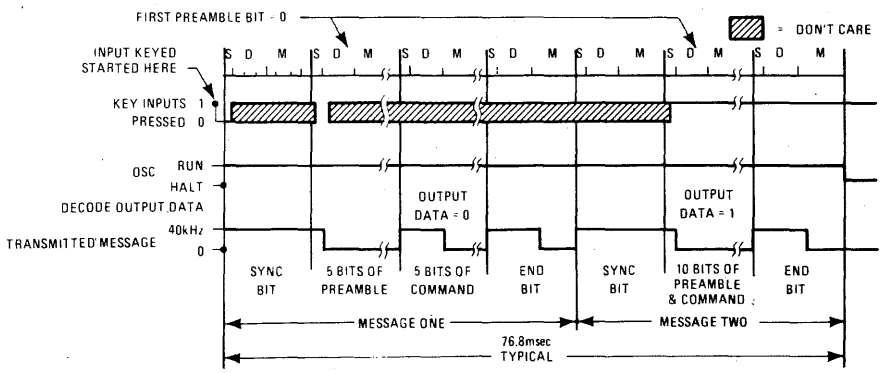


The S2601 has five other outputs: Pulse Train, On/Off, Analog A, Analog B, and Analog C. The states of these outputs are controlled by the 10 particular Binary Output codes which the receiver Keyboard Inputs can cause to be generated. The Pulse Train output provides a 2.44 Hz square wave (50% duty factor) whenever 11011 appears at the Binary Outputs, but otherwise it remains at a logic "0". This pulse train can be used for indexing, e.g., for stepping a TV channel selector.

The On/Off ("mains") output changes state each time 01111 appears at the Binary Outputs. In TV applications the On/Off output is most often used to kill and restore the main power supply.

Analog Outputs A, B, and C are 10 kHz pulse trains whose duty factors are independently controllable. With a simple low-pass filter each of these outputs can provide 64 distinct DC levels suitable for control of volume, color saturation, brightness, motor speed, etc. Each Analog Output increases its duty factor in response to a particular Binary Output code and decreases its duty factor in response to another code — 6 codes in all. The entire range of 0% to 100% duty factor can be traversed in 26 seconds or at a rate of the oscillator frequency divided by 262,144. All three Analog Outputs are set to 50% duty factor whenever 01011 appears at the Binary Outputs. Analog A is mutable; 01100 sets it to 0% duty factor. If 01100 then disappears and reappears, the original duty factor is restored. This of course implements the TV "sound killer" feature.

The S2601 has an on-chip power-on reset (POR) circuit which sets the Pulse Train and On/Off Outputs to "0," sets the Analog Outputs at 50% duty factor, and insures that Analog A is muted. No external components are required to implement POR, but a POR input has been provided for applications where externally controlled reset is desirable, e.g., where the power supply voltage rise time is extremely slow. The POR input has an internal resistor pull-up to V_{SS}; pulling it low causes a reset.



Message Bit Format

* "1" MEANS PRESENCE OF A 40kHz CARRIER (SQUARE WAVE); "0" MEANS ABSENCE OF A 40kHz CARRIER (SQUARE WAVE).

** IF MESSAGE BIT = "1" THEN DECODER DATA OUTPUT = ENCODER DATA INPUT = "0";
IF MESSAGE BIT = "0" THEN DECODER DATA OUTPUT = ENCODER DATA INPUT = "1".

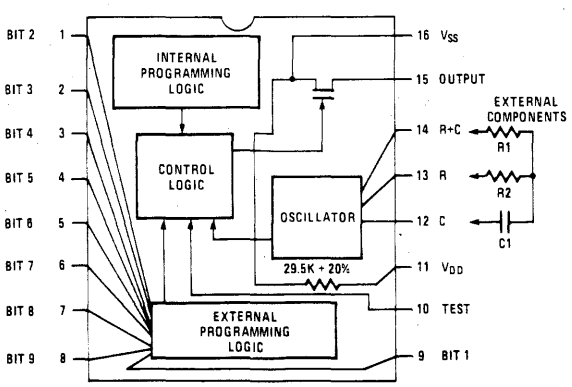
ENCODER/DECODER REMOTE-CONTROL 2-CHIP SET

Features

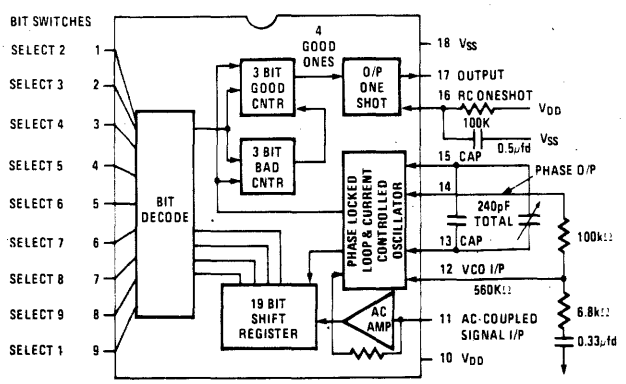
- ☐ **Lower System Costs**
  - **RC oscillator used on encoder (no crystal required)**
  - **Phase-locked-loop on decoder (no crystal required)**
  - **Single binary inputs allow inexpensive switches on pc board jumpers**
- ☐ **Flexibility of Application**
  - **512 user selectable address codes**
  - **Decoder signal valid output**
  - **Externally selectable one-shot tailors message reception**
  - **User has choice of transmission media: infrared, ultrasonic, RF, or hardware**
  - **Eight ROM programmable preamble codes**
  - **Encoder operates on a single 9V battery**
- ☐ **Reliable System Operation**
  - **Frequency shift keying scheme means low reception error**
  - **PLL allows frequency variation ± 15% between encoder and decoder**
  - **One-shot period allows adjustment for system noise**
  - **Triple message redundancy required**
  - **Preamble adds to message security**
  - **High noise immunity**

General Description



Encoder/Decoder

This two chip PMOS set includes a user programmable serial data encoder for use in a simple low power transmitter and a serial data decoder for use in a user addressable receiver. The user can select the transmission medium (RF, infrared ultrasonic, or hard wired). The externally selectable message allows up to 512 codes or addresses; this is done with the nine binary inputs on each device. An additional 3 bits of address can be programmed on chip as a fixed preamble.



The serial data encoder encodes by means of a frequency-shift-keyed trinary data pattern composed of 16 data bits. Each data bit will have a length equivalent to 32 cycles of high frequency clock (20kHz typical). Each trinary data pattern will be 512 cycles of 1/2 the oscillator frequency length. The encoder frequency oscillator reference is controlled with an external RC network. The encoder transmitter can be powered by a single 9 volt battery so that a single momentary push button will activate the encoder and transmitter. In the off position there is no current flow.

The serial data decoder in conjunction with a receiver amplifier decodes the transmitted 16 bit coded signal. The on-chip phase-locked-loop locks in on the 20kHz signal even if the transmitted frequency differs from the receiver by up to ± 15%. The coded signal input is

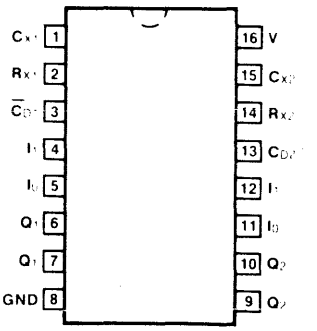
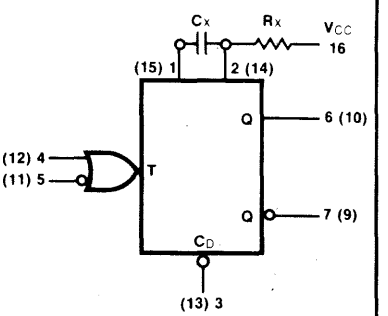
ADVANCED PRODUCT DESCRIPTION



96S02
96LS02

DUAL RETRIGGERABLE RESETTABLE MONOSTABLE MULTIVIBRATOR



DESCRIPTION — The 96S02 and 96LS02 are dual retriggerable and resettable monostable multivibrators. These one-shots provide exceptionally wide delay range, pulse width stability, predictable accuracy and immunity to noise. The pulse width is set by an external resistor and capacitor. Resistor values up to 1.0 MΩ for the 96LS02 and 2.0 MΩ for the 96S02 reduce required capacitor values. Hysteresis is provided on both trigger inputs of the 96LS02 and on the positive trigger input of the 96S02 for increased noise immunity.

- **REQUIRED TIMING CAPACITANCE REDUCED BY FACTORS OF 10 TO 100 OVER CONVENTIONAL DESIGNS**
- **BROAD TIMING RESISTOR RANGE — 1.0 kΩ to 2.0 MΩ**
- **OUTPUT PULSE WIDTH IS VARIABLE OVER A 2000:1 RANGE BY RESISTOR CONTROL**
- **PROPAGATION DELAY OF 35 ns 96LS02, 12 ns 96S02**
- **0.3 V HYSTERESIS ON TRIGGER INPUTS**
- **OUTPUT PULSE WIDTH INDEPENDENT OF DUTY CYCLE**
- **35 ns TO ∞ OUTPUT PULSE WIDTH RANGE**

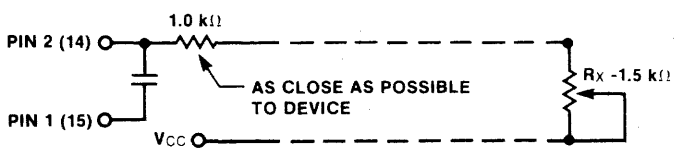
LOGIC DIAGRAM

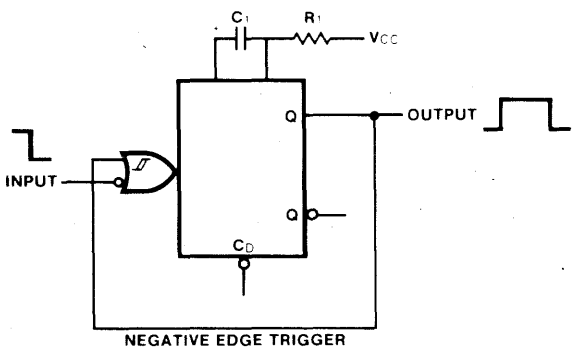


FUNCTIONAL DESCRIPTION — The 96S02 and 96LS02 dual retriggerable resettable monostable multivibrators have two dc coupled trigger inputs per function, one active LOW ($\overline{I_0}$) and one active HIGH (I_1). The I_1 input of both circuit types and the $\overline{I_0}$ input of the 96LS02 utilize an internal Schmitt trigger with hysteresis of 0.3 V to provide increased noise immunity. The use of active HIGH and LOW inputs allows either rising or falling edge triggering and optional non-retriggerable operation. The inputs are dc coupled making triggering independent of input transition times. When input conditions for triggering are met the Q output goes HIGH and the external capacitor is rapidly discharged and then allowed to recharge. An input trigger which occurs during the timing cycle will retrigger the circuit and result in Q remaining HIGH. The output pulse may be terminated (Q to the LOW state) at any time by setting the Direct Clear input LOW. Retriggering may be inhibited by tying the $\overline{Q}$ output to $\overline{I_0}$ or the Q output to I_1. Differential sensing techniques are used to obtain excellent stability over temperature and power supply variations and a feedback Darlington capacitor discharge circuit minimizes pulse width variation from unit to unit. Schottky TTL output stages provide high switching speeds and output compatibility with all TTL logic families.

Operation Notes

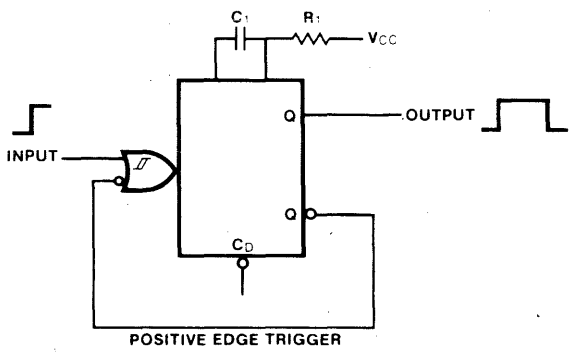
TIMING

1. An external resistor (R_X) and an external capacitor (C_X) are required as shown in the Logic Diagram. The value of R_X may vary from 1.0 kΩ to 1.0 MΩ (96LS02) or 2.0 MΩ (96S02).
2. The value of C_X may vary from 0 to any necessary value available. If, however, the capacitor has significant leakage relative to V_{CC}/R_X the timing equations may not represent the pulse width obtained.
3. Polarized capacitors may be used directly. The (+) terminal of a polarized capacitor is connected to pin 1 (15), the (-) terminal to pin 2 (14) and R_X. Pin 1 (15) will remain positive with respect to pin 2 (14) during the timing cycle. In the 96S02, however, during quiescent (non-triggered) conditions, pin 1 (15) may go negative with respect to pin 2 (14) depending on values of R_X and V_{CC}. For values of $R_X \geq 10$ kΩ the maximum amount of capacitor reverse polarity, pin 1 (15) negative with respect to pin 2 (14) is 500 mV. Most tantalum electrolytic capacitors are rated for safe reverse bias operation up to 5% of their working forward voltage rating; therefore, capacitors having a rating of 10 WVdc or higher should be used with the 96S02 when $R_X \geq 10$ kΩ.
4. The output pulse width t_w for $R_X \geq 10$ kΩ and $C_X \geq 1000$ pF is determined as follows:
   (96S02) $t_w = 0.55\ R_X C_X$
   (96LS02) $t_w = 0.43\ R_X C_X$
   Where R_X is in kΩ, C_X is in pF, t is in ns *or* R_X is in kΩ, C_X is in μF, t is in ms.
5. The output pulse width for $R_X < 10$ kΩ or $C_X < 1000$ pF should be determined from pulse width versus C_X or R_X graphs.
6. To obtain variable pulse width by remote trimming, the following circuit is recommended:



©IC MASTER 1979

Operation Notes (Cont'd)



7. Under any operating condition, C_X and R_X (Min) must be kept as close to the circuit as possible to minimize stray capacitance and reduce noise pickup.
8. V_{CC} and ground wiring should conform to good high frequency standards so that switching transients on V_{CC} and ground leads do not cause interaction between one shots. Use of a 0.01 μF to 0.1 μF bypass capacitor between V_{CC} and ground located near the circuit is recommended.

TRIGGERING

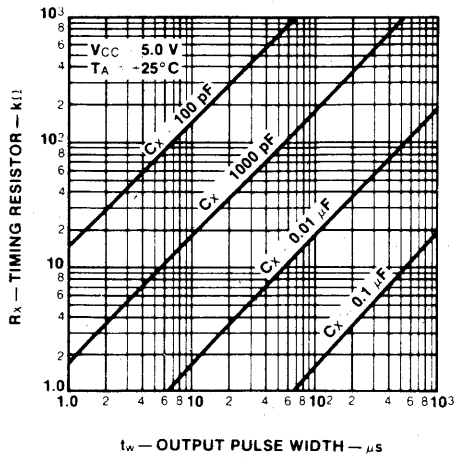
1. The minimum negative pulse width into $\overline{I}_0$ is 8.0 ns; the minimum positive pulse width into I_1 is 12 ns.
2. Input signals to the 96S02 exhibiting slow or noisy transitions should use the positive trigger input I_1 which contains a Schmitt trigger. Input signals to the 96LS02 exhibiting slow or noisy transitions can use either trigger as both are Schmitt triggers.
3. When non-retriggerable operation is required, i.e., when input triggers are to be ignored during quasi-stable state, input latching is used to inhibit retriggering.

NEGATIVE EDGE TRIGGER

POSITIVE EDGE TRIGGER

4. An overriding active LOW level direct clear is provided on each multivibrator. By applying a LOW to the clear, any timing cycle can be terminated or any new cycle inhibited until the LOW reset input is removed. Trigger inputs will not produce spikes in the output when the reset is held LOW. A LOW-to-HIGH transition on $\overline{C}_D$ will not trigger the 96S02 or 96LS02. If the $\overline{C}_D$ input goes HIGH coincident with a trigger transition, the circuit will respond to the trigger.

TRIGGERING TRUTH TABLE



PIN NO'S. 5 (11)	4 (12)	3 (13)	OPERATION

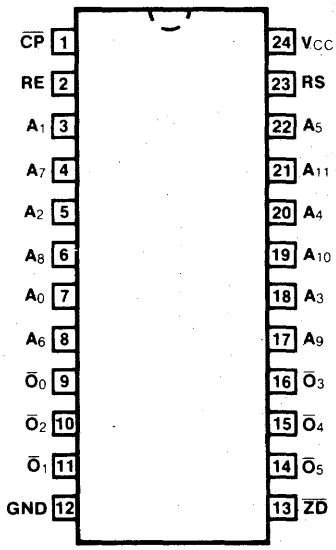
96LS32



ADDRESS MULTIPLEXER/REFRESH COUNTER

(For 4K Dynamic RAMs)

DESCRIPTION — The 96LS32 is an address multiplexer and refresh counter for multiplexed address dynamic RAMs requiring refresh of up to six input addresses (or 4K bits for 64 x 64 organization). It multiplexes 12 bits of system applied address to six output address pins. The device also contains a 6-bit refresh counter which is externally clocked so that either distributed or burst refresh may be used. The high performance of the 96LS32 makes it especially suitable for use with high speed n-channel RAMs like the M4027. The 96LS32 operates from a single +5.0 V power supply and is specified for operation over a 0°C to +75°C ambient temperature range.

- **SIMPLIFIES SYSTEM DESIGN**
- **REDUCES PACKAGE COUNT**
- **DRIVES HIGH CAPACITANCE LOADS**
- **USE FOR DISTRIBUTED OR BURST REFRESH**
- **STANDARD 24-PIN DUAL IN-LINE PACKAGE**
- **LOW POWER SCHOTTKY DESIGN MINIMIZES POWER CONSUMPTION**

LOGIC DIAGRAM

LOGIC SYMBOL

V_{CC} = Pin 24
GND = Pin 12

©IC MASTER 1979

FUNCTIONAL DESCRIPTION — The 96LS32 address multiplexer/refresh counter performs the following functions:

1. Row, Column and Refresh Address multiplexing
2. Address counting for burst or distributed refresh

These functions are controlled by two signals, Refresh Enable and Row Select, both of which are active HIGH TTL inputs. the Function Table shows the levels required to multiplex to the output:

1. Refresh address (from internal counter)
2. Row addresses (A_0 through A_5)
3. Column addresses (A_6 through A_{11})

BURST REFRESH MODE — When refresh is requested the Refresh Enable input is HIGH. This input is ANDed with the six outputs of the internal 6-bit counter. At each $\overline{CP}$ pulse the counter increments by one, sequencing the outputs ($\overline{O}_0 - \overline{O}_5$) through all 64 row addresses. When the counter sequences to all zeroes, the Zero Detect output goes LOW signaling the end of the refresh sequence. Due to counter decoding spikes, the Zero Detect output is valid only after t_{cz} following the LOW going edge of $\overline{CP}$.

DISTRIBUTED REFRESH MODE — In the distributed refresh mode, one row is selected for refresh each ($t_{refresh/n}$) time where n = number of rows in the device and refresh is the specified refresh rate for the device. For the M4027, $t_{refresh}$ = 2.0 ms and n = 64, therefore one row is refreshed each 31 μs. Following the refresh cycle at row n, the $\overline{CP}$ input is pulsed, advancing the refresh address by one row so that the next refresh cycle will be performed on row n + 1. The $\overline{CP}$ input may be pulsed following each refresh cycle or within the refresh cycle after the specified memory device address hold time.

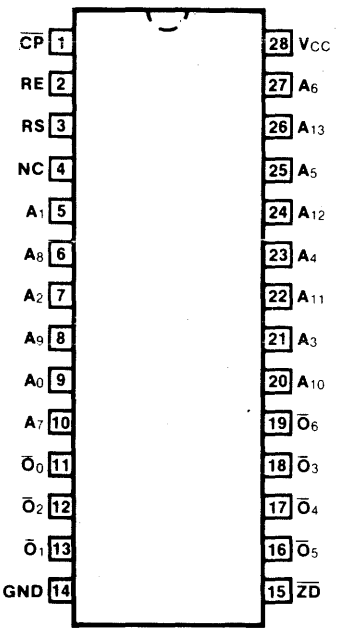
ROW AND COLUMN ADDRESS — All twelve system address lines are applied to the inputs of the 96LS32. When Refresh Enable is LOW and Row Select is HIGH, the input addresses $A_0 - A_5$ are gated to the outputs and applied to the driven memories. Conversely, when Row Select is LOW (with Refresh Enable still LOW), input addresses $A_6 - A_{11}$ are gated to the outputs and applied to the driven memories. When memory devices are driven directly by the 96LS32, the address applied to the memory devices is the inverse of the address at the inputs due to the inverted outputs of the 96LS32. This should be remembered when checking out the memory system.

FUNCTION TABLE

Refresh Enable	Row Select	Outputs
H	X	Refresh Address (from internal counter)
L	H	Row Address (complement of $A_0 - A_5$)
L	L	Column Address (complement of $A_6 - A_{11}$)

H = HIGH Voltage Level
L = LOW Voltage Level
X = Immaterial

96LS42



ADDRESS MULTIPLEXER/REFRESH COUNTER

(For 16K Dynamic RAMs)

DESCRIPTION — The 96LS42 is an address multiplexer and refresh counter for multiplexed address dynamic RAMs requiring refresh of 64 or 128 cycles. It multiplexes 14 bits of system supplied address to seven output address pins. The device also contains a 7-bit refresh counter which is externally controlled so that either distributed or burst refresh may be used. The high performance of the 96LS42 makes it especially suitable for use with high speed n-channel RAMs like the F16K. The 96LS42 is manufactured using Fairchild's advanced low power Schottky process.

- **SIMPLIFIES SYSTEM DESIGN**
- **REDUCES PACKAGE COUNT**
- **DRIVES HIGH CAPACITIVE LOADS**
- **EITHER BURST OR DISTRIBUTED REFRESH**
- **LOW POWER SCHOTTKY DESIGN**
- **STANDARD 28-PIN PACKAGE**

©IC MASTER 1979

FUNCTIONAL DESCRIPTION — The 96LS42 address multiplexer/refresh counter performs the following functions:

1. Row, Column and Refresh Address multiplexing
2. Address counting for burst or distributed refresh

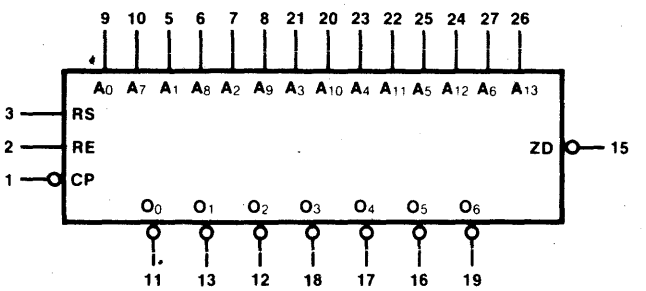
These functions are controlled by two signals, Refresh Enable and Row Select, both of which are active HIGH TTL inputs. The Function Table shows the levels required to multiplex to the output:

1. Refresh addresses (from internal counter)
2. Row addresses (A_0 through A_6)
3. Column addresses (A_7 through A_{13})

Burst Refresh Mode — When refresh is requested the Refresh Enable input is HIGH. This input is AND-ed with the seven outputs of the internal 7-bit counter. At each $\overline{CP}$ pulse the counter increments by one, sequencing the outputs ($\overline{O}_0 - \overline{O}_6$) through all 128 row addresses. When the counter sequences to all zeroes, the Zero Detect output goes LOW signaling the end of the refresh sequence. Due to counter decoding spikes, the Zero Detect output is valid only after t_{cz} following the LOW going edge of $\overline{CP}$.

Distributed Refresh Mode — In the distributed refresh mode, one row is selected for refresh each ($t_{refresh/n}$) time where n = number of rows in the device and refresh is the specified refresh rate for the device. For the F16 k, Refresh = 2.0 ms and n = 128, therefore one row is refreshed each 62 μS. Following the refresh cycle at row n, the $\overline{CP}$ input is pulsed, advancing the refresh address by one row so that the next refresh cycle will be performed on row n + 1. The $\overline{CP}$ input may be pulsed following each refresh cycle or within the refresh cycle after the specified memory device address hold time.

Row and Column Address — All 14 system address lines are applied to the inputs of the 96LS42. When Refresh Enable is LOW and Row Select is HIGH, the input Addresses $A_0 - A_6$ are gated to the outputs and applied to the driven memories. Conversely, when Row Select is LOW (with Refresh Enable still LOW). Input addresses $A_7 - A_{13}$ are gated to the outputs and applied to the driven memories. When memory devices are driven directly by the 96LS42, the address applied to the memory devices is the inverse of the address at the inputs due to the inverted outputs of the 96LS42. This should be remembered when checking out the memory system.



FUNCTION TABLE

Refresh Enable	Row Select	Outputs
H	X	Refresh Address (from internal counter)
L	H	Row Address (complement of $A_0 - A_6$)
L	L	Column Address (complement of $A_7 - A_{13}$)

H = HIGH Voltage Level
L = LOW Voltage Level

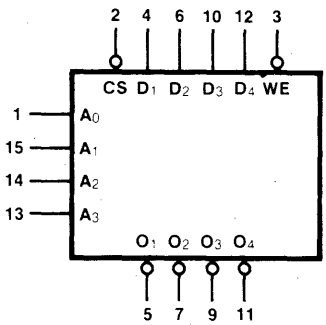
54S/74S189
54LS/74LS189

64-BIT RANDOM ACCESS MEMORY

(With 3-State Outputs)



CONNECTION DIAGRAM
PINOUT A

DESCRIPTION — The '189 is a high speed 64-bit RAM organized as a 16-word by 4-bit array. Address inputs are buffered to minimize loading and are fully decoded on-chip. The outputs are 3-state and are in the high impedance state whenever the Chip Select ($\overline{CS}$) input is HIGH. The outputs are active only in the Read mode and the output data is the complement of the stored data.

- **3-STATE OUTPUTS FOR DATA BUS APPLICATIONS**

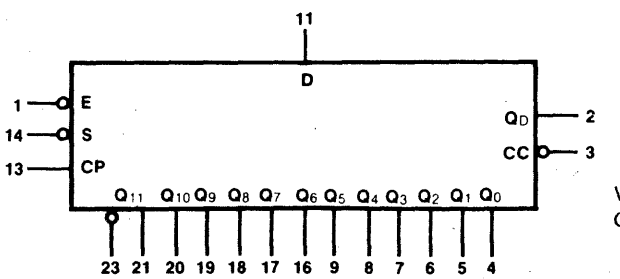
54LS/74LS504

12-BIT SUCCESSIVE APPROXIMATION REGISTER

(With Expansion Control)

CONNECTION DIAGRAM
PINOUT A



DESCRIPTION — The 'LS504 performs serial-to-parallel conversion and provides a Conversion Complete ($\overline{CC}$) signal. The 'LS504 is a 12-bit version of the 8-bit 'LS502 and has an active LOW Enable ($\overline{E}$) input for expansion, similar to the 'LS503. For detailed discussion of the various operations, please see the 'LS502 and 'LS503 data sheets.

- **PERFORMS SERIAL-TO-PARALLEL CONVERSION**

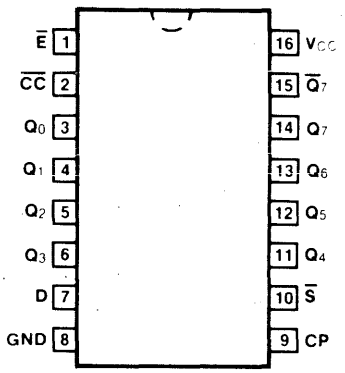
54LS/74LS503



8-BIT SUCCESSIVE APPROXIMATION REGISTER

(With Expansion Control)

DESCRIPTION — The 'LS503 register is basically the same as the 'LS502 except that it has an active LOW Enable ($\overline{E}$) input that is used in cascading two or more packages for longer word lengths. A HIGH signal on $\overline{E}$, after a START operation, forces Q_7 HIGH and prevents the device from accepting serial data. With the $\overline{E}$ input of an 'LS503 connected to the $\overline{CC}$ output of a preceding (more significant) device, the 'LS503 will be inhibited until the preceding device is filled, causing its $\overline{CC}$ output to go LOW. This LOW signal then enables the 'LS503 to accept the serial data on subsequent clocks. For a description of the starting, shifting and conversion operations, please see the 'LS502 data sheet.

LOGIC DIAGRAM

Note: Cell logic is repeated for register stages Q_5 to Q_1.

HERE ARE 9 COMPELLING REASONS FOR HAVING US PRODUCE A CUSTOM LSI CIRCUIT FOR YOU:

1. The money you'll save. Production cost will be lower since you'll only be wiring in one chip instead of many. And you'll save money on quality control, inventory, and in-plant handling.

2. The improved reliability of your product.

3. Proprietary protection: a custom circuit is almost impossible to copy.

4. Enhanced marketability: extra functions not included in original chip concept can be loaded on the chip—usually at no extra cost—enabling product to do things it never could before.

5. At LSI Computer Systems, Inc., your chip receives full-time attention by experts, whatever the size of your order.

6. It is produced on the finest most advanced processing equipment, with the MOS technique best suited to your requirements.

7. Each chip receives 100% functional testing.

8. The "prototypes" you receive for your verification are random samples from an actual production run, not products of special prototype line.

9. LSI Computer Systems, Inc., has been helping companies large and small realize the full benefits of MOS/LSI circuits for over nine years. All of its engineers have been involved with MOS since its infancy.

AND HERE ARE 14 HOTSHOT STANDARD CIRCUITS FOR YOU TO USE RIGHT NOW:

COUNTERS

For DC to 5MHz counting applications.

LS7030: DC to 5MHz eight decade MOS up counter with 8 decade latch and multiplexer.

Multiplexed BCD and 7 segment outputs. Single power supply +4.75 to +15 VDC (full frequency range over full voltage range). Compatible with CMOS logic. Counter output latches. Leading zero blanking. 40 pin DIP.

For 5MHz to 500MHz counting applications.

LS7031: DC to 5MHz six decade MOS up counter with 8 decade latch and multiplexer.

Multiplexed BCD outputs. Access to LSD latches allows attachment of prescalers for counting to 500 MHz. Leading zero blanking. Single power supply operation +4.75 to +15VDC (full frequency range over full voltage range). Compatible with CMOS logic. 40 pin DIP.

For multi-comparison applications where parallel outputs are required.

LS7040: Dual 3 decade up/down counter with parallel BCD outputs.

Selectable as 6 decade or dual 3 decade up/down counter. DC to 350KHz count frequency at +5 volts. Fully synchronous operation. Inputs CMOS, TTL, and DTL compatible at +5V operation. Reset. Count enable. Power-on-reset. 40 pin DIP.

For counting applications requiring presignalling and recycling.

LS 7050: DC to 50 KHz six decade up/down counter.

Counting down: 2 signals, optional recycling; counting up: 2 signals, optional recycling, zero detect output. Divide by 5 or 6 inputs. 7-segment output. Latches. Leading zero blanking. High noise immunity. All outputs CMOS compatible over entire power supply range (+5V to +15V) 40-pin DIP.

For DC to 10 MHz counting applications.

LS 7060: DC to 10 MHz 32-bit MOS binary counter with 32-bit latch and multiplexer.

8-bit tri-state multiplexed outputs. Single power supply +4.75 to +5.25 VDC. Bus compatible. 18-pin DIP.

For DC to 2.56 GHz counting applications.

LS 7061 DC to 10 Mhz 32-bit MOS up counter with 40 bit latch and multiplexer.

8-bit tri-state multiplexed outputs. Access to 8 LSB latches allows attachment of prescalers for counting to 2.56 GHz. Single power supply operation +4.75 to +5.25 VDC. Bus compatible. 24-pin DIP.

For timing applications requiring keyboard control.

LS7090: 9 decade keyboard controlled Up/Down timer or counter with memory providing 7 segment display, comparator and tone outputs.

Interfaces directly with key switches of standard keyboard. Automatic or keyboard-controlled reset. Divide by 5 or 6 inputs. Contents of memory counter can be displayed at any time. Schmitt trigger count input. Leading zero blanking. Single pin scan oscillator controls. CMOS type noise immunity. All inputs protected, and CMOS, TTL, and DTL compatible at 5V operation. 40-pin DIP.

COMPARATOR

For multicomparison applications; to be used with LS7040.

LS7240: 7 level comparator/multiplexer with parallel BCD inputs. Seven comparators can be loaded with one set of thumbwheel switches. Contents of any comparator constantly available for 7-segment display. Two or more 7240s can be used with one 7040, offering as many levels as needed. 24-pin DIP.

NUMERIC DISPLAY DRIVER

For liquid crystal or gas discharge displays requiring up to 60V

LS7100: BCD to 7 segment latch/decoder/driver.

Ion-implanted P Channel MOS circuit compatible with CMOS and TTL systems. Drive voltages up to 60V. 16 pin DIP.

MULTIPLEXER/ALPHA-NUMERIC DISPLAY DRIVER

For switching applications and alpha-numeric display applications requiring up to 60V.

LS7110: Binary addressable latched 8-channel multiplexer/demultiplexer/driver.

Ion-implanted P Channel MOS circuit compatible with CMOS and TTL systems. Drive voltages up to 60V. 16 pin DIP.

CLOCK CIRCUIT

For direct drive of large liquid crystal display clocks from 50/60Hz.

C1200: MOS digital clock circuit.

Directly drives liquid crystal displays (80V P-P across LCD), 50/60Hz AC input. 12 hour clock format (hours and minutes). Independent minute and hour set at 2Hz rate. Flashing 1 second indicator. 28 pin DIP.

DIVIDERS

For applications requiring 10 pulses per second from 50/60Hz input.

RED 5/6: CMOS divider.

Input shaping network. Resettable. Division select input 50/60Hz. Clock enable input. 8 pin* mini-DIP.

For applications requiring 1 pulse per second from 50/60Hz input.

RED 50/60: CMOS divider.

Input shaping network. Resettable. Division select input 50/60Hz. Clock enable input. 8 pin* mini-DIP.

For applications requiring 1 pulse per minute from 50/60Hz input.

RED 3000/3600: CMOS divider.

Input shaping network. Resettable. Division select input 50/60Hz. Clock enable input. 8 pin* mini-DIP.

* Inputs so arranged that circuit cannot be damaged if plugged in backwards.

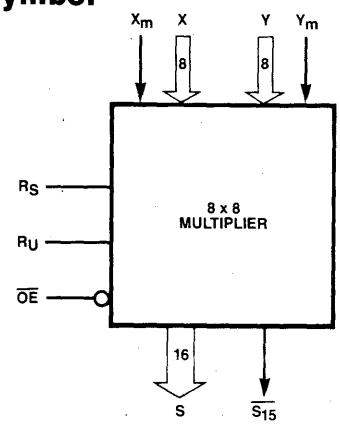
8 x 8 Multiplier

67558/57558
67558-1/57558-1

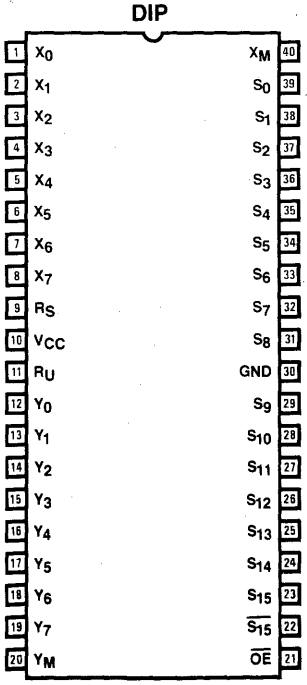
Features/Benefits



- **Unsigned, Signed, or Mixed Multiplication**
- **Rounding Inputs for Signed or Unsigned Operation**
- **Inverted Most Significant Output for Signed Expansion**
- **Three-State Outputs for Bus Operation**
- **High Speed—125 ns Max**

PART NUMBER	PACKAGE	TEMPERATURE RANGE
67558, 67558-1	D40	0°C TO +75°C
57558, 57558-1	D40	−55°C TO +125°C
57558, 57558-1	F42	−55°C TO +125°C

Description



The 57558/67558 is a high speed 8 x 8 combinatorial Multiplier which can multiply two eight-bit unsigned or signed 2s complement numbers and generate the sixteen-bit unsigned or signed product. Each input operand X and Y has an associated Mode control line, X_M and Y_M respectively. When a Mode control line is at a Low logic level the operand is treated as an unsigned eight-bit number while if the Mode control is at a High logic level the operand is treated as an eight-bit signed 2s complement number. Two additional inputs R_S and R_U allow the addition of a bit in the multiplier array at the appropriate bit positions for rounding signed or unsigned fractional numbers. The most significant product bit is available in both True and Complement form to assist in expansion to larger signed multipliers. The product outputs are three-state, controlled by an active Low Output Enable which allows several Multipliers to be connected to a parallel bus or be used in a pipelined system. The device uses a single +5V power supply and is packaged in a standard 40-pin DIP.

Functional Description

The 57558/67558 Multiplier is an 8 x 8 combinatorial logic array capable of multiplying numbers in unsigned, signed 2s complement, or mixed notation. Each eight-bit input operand X and Y has associated with it a mode control which determines whether the array treats the number as signed or unsigned. If the mode control is at a High Logic level then the operand is treated as a 2s complement number with the most significant bit having a negative weight, while if the mode control is at a Low Logic level then the operand is treated as an unsigned number.

The multiplier provides all 16 product bits generated by the multiplication. For expansion during signed or mixed multiplication the most significant product bit has both true and complement available. This allows an adder to be used as a subtractor in many applications and eliminates the need for SSI circuits.

Two inputs, R_S and R_U, are additional inputs to the array which allow the addition of a bit at the appropriate positions in the array so as to provide rounding to the best signed or unsigned fractional eight-bit result. These inputs can also be used for rounding in larger multipliers.

The product outputs of the multiplier are controlled by an active Low Output Enable control. When this control is at a Low Logic level the multiplier outputs are active, while if the control is at a High Logic level then the outputs are placed in a high-impedance state. This three-state capability allows multipliers to be placed on a common bus and also allows pipelining of multiplications for higher speed systems.

67516/67518 16x16 Multiplier/Divider
67508 8x8 Multiplier/Divider

PRELIMINARY

Product Information

67516 16 x 16 (67508 8 x 8) Multiplier/Divider

The 67516 (67508) is a bus organized family of 16 x 16 and 8 x 8 Multiplier/Divider. The device provides both multiplication and division of 2s complement 16 (8) bit numbers at high speed. There are 16 different multiply options including positive and negative multiply, positive and negative accumulation, multiplication by a constant and both single and double length addition in conjunction with the multiplication. Seven different divide options allow single or double length division, division of a previously generated number, division by a constant, and continual division of a remainder or quotient. The 67516 (67508) is a time sequenced device requiring a single clock and loads operands and presents results to a bi-directional 16 (8) bit-bus. The loading of the operands, reading of the results and control of the device is performed by a 3-bit control field. The device has the additional feature that operands and results can be either integers or fractions and when dealing with fractions, automatic scaling occurs. Results can be rounded if required and an Overflow output indicates whenever a result is outside the normally accepted number range. For a simple multiplication of two operands and reading of the double length result the device takes n/2 clock periods, a worst case clock period of 100 ns gives a multiplication time of 800 ns worst case for 16 x 16 multiplication and 400 ns for 8 x 8. More complex multiplications will take additional clock periods for loading the additional operands. A simple divide operaton will take n + 4 clock periods for a worst case time of 2μs (32 bits/16 bits) and 1.2μs (16 bits/8 bits).

The device uses standard low-power Schottky technology to produce a single +5V supply TTL compatible device. Bus input and control and clock inputs require less than 1mA input current, and bus outputs are three-state sinking 8mA at the low logic level. These devices will be available both in a commercial and military temperature range and packaged in 24 pin (16 x 16) and 16 pin (8 x 8) dual-in-line packages. Power consumption will be approximately 1 watt and 0.75 watts respectively to give a worst case clock period over the military temperature range of 100 ns.

Device Operation

The Multiplier/Divider contains four working registers each of 16 (8) bits. These registers are Y the Multiplier register, X the Multiplicand and Divisor register, W which is the least significant half of a double length accumulator and holds the least significant half of the product after a multiplication or the quotient after a division operation. In addition to the registers, there is a high speed arithmetic unit which performs addition, subtraction and shifting operations in order to generate the required arithmetic functions, a loading sequencer and a PLA control network.

Operands are loaded into the working registers in time sequence at each clock period under the control of a sequencer. A load signal must be low in order for the clock to activate the loading process and continue to the next step in the loading operation. After all the operands are loaded, the device jumps to the multiply or to the divide routine and performs the required operation. After n/2 clock periods for a multiply (or n + 4 clock periods for a divide), the device is ready to place the result on the bus in time sequence.

Three control inputs $I_{0,1,2}$ select the required function and drive the sequencer from state to state. So the action of the Multiplier/Divider at any clock period is a function of the machine state and the state of the control inputs. Figure 1 shows the Multiply/Divide State Table and all possible operations. After a Read or Round operation the machine is driven back to State 0 and a new sequence of arithmetic operations is assumed. If a chain operation is being performed, such as accumulate products, then State 0 is bypassed and loading of an operand or jumping to the arithmetic operation occurs at the end of the previous arithmetic operation at State 32 for a Multiply, or State 33 for a Divide.

Register X is a dual rank register which allows the loading of operand X during the multiplication or division process. If the machine enters the loading sequence and a new X operand has not been loaded then the machine proceeds with the previously loaded X. This loading while processing allows a cycle to be saved during chain calculations and also allows multiplication and division by a constant.

Figures 2 and 3 show the codes and time taken for the 23 different arithmetic operations possible. These operations can be concatenated in strings to perform complex arithmetic 2s complement operations at high speed. Rounding and reading of results can be performed after any operation.

Figure 4 is a block diagram of the nxn Multiplier/Divider.

Multiplication

The 67516 (67508) provides 2s complement 16 (8) bit multiplication, and can also accumulate previously generated double products. No time penalty is incurred for accumulation since the machine accumulates while the multiplication operation is proceeding. In addition to accumulation the device can add in to a product either a single length or double length number. It can also use a previously loaded operand as a constant so that constant multiplication and accumulation is possible.

One key feature is the ability to perform both positive and negative multiplications again without any speed penalty. This feature allows complex multiplications to be programmed simply. Another important feature is the ability to work in fractions or integers.

©IC MASTER 1979

Division

The 67516 (67508) also provides a range of division operations. A double length number in Z,W is divided by X, and the result Q is stored in Z and the remainder R in W. Again all numbers are in the 2s complement number representation with the most significant bit of an operand, whether double or single length, having a negative weight. In order to facilitate repeated division and have a multiple length quotient keep the same sign, the remainder is always the same sign as the dividend. Fractional or integer operation is possible and division and multiplication operations can be concatenated. For example, the operations (A x B)/C, (A/B) x C can easily be performed. The dividend can be any previously generated result, product, quotient, remainder, or a double or single length signed operand.

Reading Results

Results of an arithmetic operation, or string of operations, can be read onto the 16 (8) bit bus if the machine is at the end of an operation or at the start of a new sequence. The read operation requires that the load signal is held Low whereby the information is read out onto the bi-directional bus when Code 7 is specified. (See Figure 5) Since there is a double length accumulator Z,W reading can take two time periods. First register Z is read out, this could be the most significant half of a product, or the quotient during a division operation. After a clock has been received and Code 7 is still present, the least significant half of the product from the W register is placed on the bus, or the remainder if a division operation was performed.

If the machine is asked to perform a read during the loading sequence then the sequence is broken and the machine is forced back to state 0 ready to start the sequence again. Continual read operations at state 0 just swap the contents of register Z and W.

Initialization of the 67516 Multiplier/Divider can easily be performed by continually calling out Code 7 which after a maximum of 21 (13) clock periods forces the machine back to State 0. The 67508/18 have a direct Reset line.

Integer and Fractional Arithmetic

The 67516 (67508) can work in either fractional or integral number representations. When working with integers all numbers are scaled from the least significant end and the least significant bit is assumed to have a weight of 2^0. For integer multiplication, accumulation, and division, all numbers are scaled from this least significant weight, and results are correct if interpreted in this manner. The double length register Z,W can therefore hold numbers in the range -2^{31} to $+2^{31}-1$ (-2^{15} to $+2^{15}-1$) and the operands X and Y and single length results are in the range -2^{15} to $+2^{15}-1$ (-2^7 to $+2^7-1$).

When working with fractions, the machine automatically performs scaling so that input operands and result have a consistent format. All numbers in the fractional representation are scaled from the most significant end which has a weight of 2^0 and is negative. The binary point is one place to the right of this most significant bit, so that the next bit has a weight of 2^{-1}. The double length register Z,W therefore holds numbers in the range -1 to $+1 - 2^{-31}$ (2^{-15}) and the operand X and Y and single length results are in the range -1 to $+1 - 2^{15}$ (2^7). Since automatic scaling occurs, the product of two numbers always has the least significant bit as a 0 unless an accumulation is performed with the least significant bit as a 1.

During a chain operation with the partial results not being read onto the bus, the machine will stay in either the fractional or integer mode. At the start of a sequence of operations, integer or fraction operation is designated by loading operands with Code 6 or Code 5 respectively.

Mixed fraction and integer working is possible by re-defining the weight of the least or most significant bit. Care, however, must be exercised due to the automatic scaling feature when fractional arithmetic is programmed.

Rounding

Rounding can be performed on the result of a multiplication or division. Generally rounding would only be called out during fractional operation but nothing in the machine precludes forming a rounded result during integer working.

Rounding for multiplication provides the best single length most significant half of the product. Rounding occurs at the end of a multiplication and is performed instead of a Load or Read operation. The machine looks at the most significant bit of the least significant half of the product (W_{15} or W_7) and adds 1 to the most significant half of the product at the least significant end if W_{15} (W_7) is a 1. After the operation the machine is in state 0 so that the rounded product can be read, and the W register is clear.

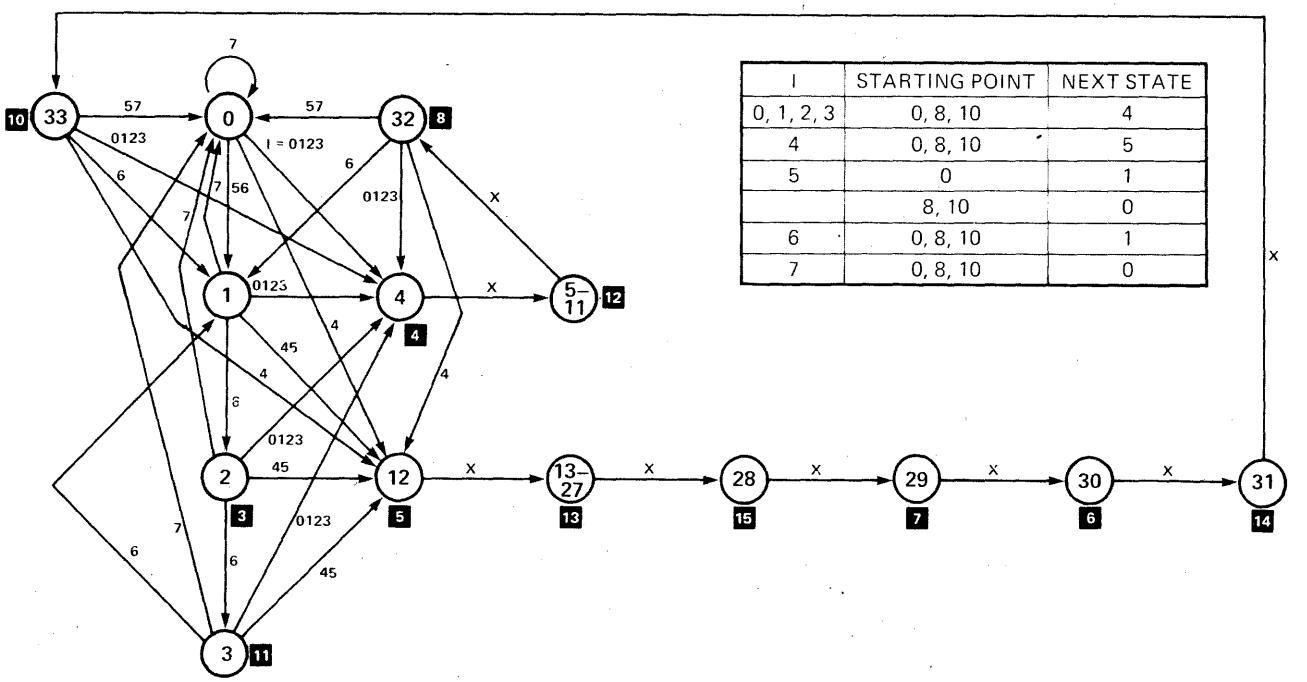
Division rounding is performed by forcing the least significant bit of the quotient in Z to a 1 unless the division is exact (remainder is zero). This method of rounding causes a slightly higher variance in the result than having an additional iterative division operation, but is considerably easier to perform. Again after rounding the machine goes to state 0 so that a read operation can be performed, and the W register is clear.

Overflow

The machine has an overflow output which is cleared prior to an operation and is set during an operation if the product or quotient goes outside the normally accepted range.

For multiplication, overflow can only occur if the most negative number in the operand range is used. $-1X\ -1 = +1$ which cannot be held in the machine. Overflow can more easily occur during accumulation of products either positively or negatively. For fractional working, if the product or accumulation goes outside the range of -1 to $+1\ -2^{-31}$ then the overflow flip-flop will be set.

Division overflow also occurs if the quotient goes outside the generally accepted number range of -1 to $+1\ -2^{-15}$ (2^{-7}) during fractional operation. This would occur if the divisor is less than the dividend or equal to the dividend if a positive quotient is being generated. For integer working the numbers must be scaled by 2^{15} (2^7).



Timing

General timing waveforms are shown in Figure 6. Specific examples are shown in Figures 7 and 8.

©IC MASTER 1979

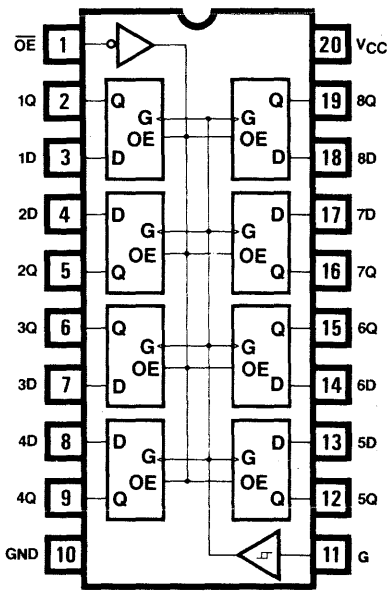
Description

The latch passes eight (octal) bits of data from the inputs (D) to the outputs (Q) when the gate (G) is high. The data is "latched" when the gate (G) goes low. The register loads eight (octal) bits of input data and passes it to the output on the "rising edge" of the clock.

The three state outputs are active when OE is low, and high impedance when OE is high. Schmitt-trigger buffers at the gate/clock inputs improve system noise margin by providing typically 400 mV of hysteresis.

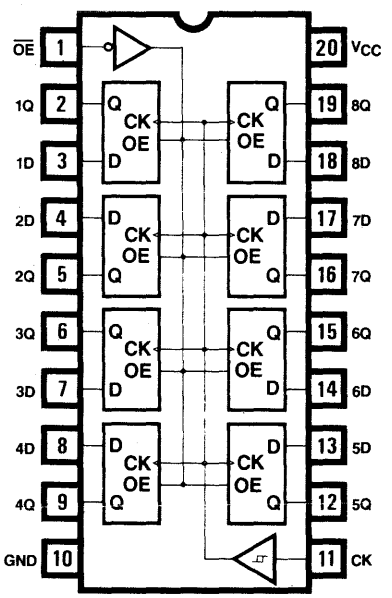
In addition to the standard S and LS latches and Registers, Monolithic Memories provides these enhancements:

1) Increased output sink current (I_{OL}) from the standard Schottky I_{OL} of 20 mA to an improved 32 mA.



2) Inverting outputs instead of the standard non-inverting outputs.

The higher I_{OL} is intended for upgrading systems which presently satisfy 32 mA requirements with SN54/74365, 366, 367, 368, Hex Buffers. The inverting outputs are intended for bus applications that require inversion as in interfacing the Am2901A 4-Bit Slice to an active low bus.



All of the octal devices are packaged in the popular 20 in. Skinny DIP.™

Octal Registers With Clear and Clock Enable

Features

- **Inverting and non-inverting outputs**
- **Slim 20-pin Skinny DIP™ saves space**
- **8 bits matches byte boundaries**
- **Ideal for microprogram instruction register**
- **Ideal for microprocessor interface**

Description

These Octal registers contain 8 D-type flip-flops and feature very low I_{CC} (17 mA typ). The LS273 and LS313 registers are loaded on the rising edge of the clock (CK) and asynchronously cleared whenever the $\overline{\text{CLEAR}}$ line is low. The LS377 and LS314 are loaded on the rising edge of the clock provided the clock enable line, $\overline{\text{CK EN}}$ is low.

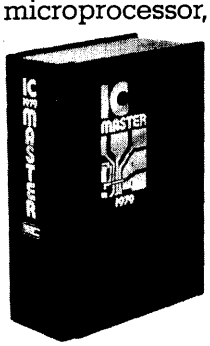
"I need to know if this device exists, and if there are any alternate sources. Where do I start?"

- Memory IC
- RAM
- Static
- 1024x1
- CMOS
- 250 Nanoseconds
- 5 Volts

If you're spending hours to solve a problem similar to the one above, you're behind the times...



It only takes a few seconds with "THE MASTER."

Clear your desk for action with the newly revised 1979 IC Master. Its all-under-one-cover features include: Over 40,000 standard products from more than 87 different companies . . . five different selection guides (memory, microprocessor, interface, linear and digital.) . . . alternate source directory for pin- for- pin, function- for- function replacements . . . applications directory . . . complete military section . . . a complete part numbering guide . . . etc.

You don't have to search through stacks of catalogs. Simply look up the specs and function you need. You don't need a part number to start with.

All you need is a problem to use The Master. Does the device exist? Who makes it? Is there an alternate source? What's the part number? Is there an applications note? Who is my closest distributor—etc.

MN9102 NON-VOLATILE LOGIC

PROVISIONAL DATA
MN9102
NON-VOLATILE QUAD LATCH

The Plessey MN9102 is a non-volatile 4-bit data latch which uses MNOS transistors as memory elements to retain stored data in the absence of applied power. The data that is applied to the four inputs is written into the memory when the SAVE control is taken to a logic '0' level and the data subsequently appears on the four outputs. The stored data is also automatically restored to the outputs whenever power is re-applied to the device.

An OUTPUT ENABLE is also available, which when taken to logic '0' level presents a high impedance state on each data output line, permitting multiplexed operation.

The high voltage ususally associated with MNOS memory devices is generated internally, requiring only a single external capacitor to act as a charge reservoir for supplying current when writing into the memory. The device therefore operates from standard voltage rails and requires no additional drive circuitry.

DC14/DG14

Fig. 1. Pin connections (top)

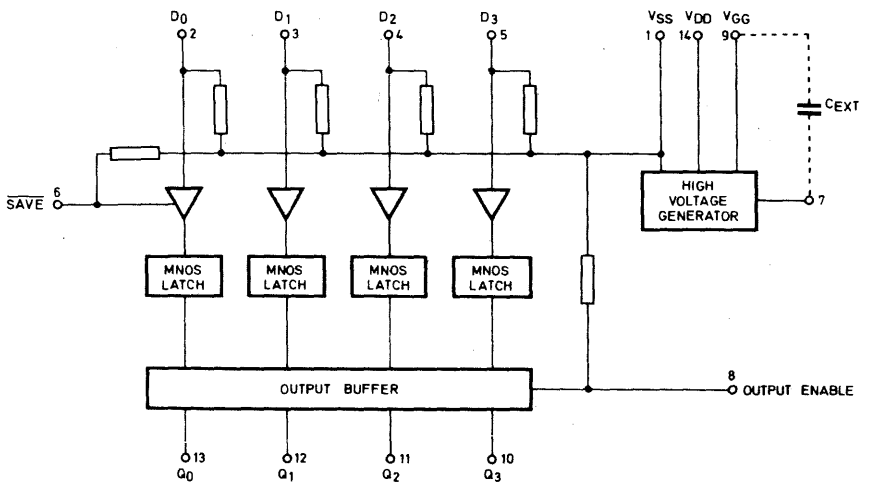

Fig. 2 Block diagram of MN9102

FEATURES

- Data Retention for One Year in the Absence of Applied Power
- Simple to Use
- Standard Power Supplies Only (+5V, −12V)
- CMOS/TTL Compatible
- 14-lead DIL Package
- Typically Ten Million SAVE Operations

APPLICATIONS

- Metering Systems
- Elapsed Time Indicators
- Security Code Storage
- Last Channel Memory for Digital Tuning

ELECTRICAL CHARACTERISTICS

Operating conditions (unless otherwise stated):
V_{SS} = +5V ± 5%
V_{DD} = 0V
V_{GG} = −12V ± 5%
Output loading = 1 TTL load
Ambient operating temperature range including data retention in the absence of applied power:
0°C to +70°C

Characteristic	Symbol	Value			Units	Conditions
		Min.	Typ.	Max.		
Logic '0' input voltage	V_{IL}			0.8	V	Nominal 20kohms internal pullup
Logic '1' input voltage	V_{IH}	V_{SS}−1			V	resistor to V_{SS} on all inputs
Logic '0' output voltage	V_{OL}			0.6	V	Output current = −1.6mA

Output leakage current		−10		+10	µA	$V_{SS} \geqslant V_{OUT} \geqslant V_{DD}$ with OUTPUT ENABLE = V_{DD}
Output voltage on C_{EXT}			−38		V	Load on $C_{EXT} \geqslant$ 10Mohms
External reservoir capacitor	C_{EXT}	0.1		0.47	µF	See note 1
Data set-up time	t_s	1			µs	
Data hold time	t_h	1			µs	
Data settling time	t_d			7	µs	C_{LOAD} = 47pf
Output enable delay	t_o			2.5	µs	C_{LOAD} = 47pf
SAVE time	t_{SAVE}	10			ms	See note 2
SAVE duty cycle				50	%	See note 3
SAVE cycles		10^6	10^7			See note 5
SAVE rise and fall times	t_e			5	µs	
Data retention time		1			year	
Power dissipation			50	100	mW	See note 4

ABSOLUTE MAXIMUM RATINGS
(all voltages with respect to Vss)

Voltage on C_{EXT} −46 to + 0.3V
Voltage on V_{GG} −20 to + 0.3V
Voltage on any other pin −7 to + 0.3V
Storage temperature −55°C to + 125°C
Ambient operating temperature −40°C to + 80°C

The above limits are absolute limiting values beyond which the lifetime and performance of the device may be impaired. No guarantee is implied that the device will function at any condition other than specified under the operating conditions.

©IC MASTER 1979

OPERATING NOTES

1. When two or more devices are used, the C_{EXT} outputs may be tied together with a single external capacitor. The size of this capacitor should be increased in proportion to the number of devices.
2. Data can be entered into the latch with SAVE times much less than ten milliseconds, however the retention time is then significantly reduced. It is therefore important that spurious SAVE pulses do not occur, particularly when power is applied to the device.
3. Duty cycles in excess of 50% may be required in certain applications. An external supply (−37V ±5%) must then be used to maintain sufficient voltage on the C_{EXT} output.
4. The majority of the power dissipation arises from the current flow between V_{SS} and V_{GG}. The current level on V_{DD} is the sum of the logic "0" level current plus leakage currents.
5. Exceeding this number of SAVE cycles can cause permanent damage to the device. It should also be noted that rapid changes of data in excess of 10^5 may cause a reduction in the data retention time.

ANTI-STATIC PRECAUTIONS

All inputs have suitable protection devices to minimise the possibility of damage due to static discharge. Care should still be taken when handling the device and the leads should at all times be shorted together until actually incorporated in the circuit in which the device is being used. Care should be taken to avoid static charges occurring in the circuit before completion and soldering should be carried out with an earthed bit.

To ensure no damage occurs during transit, the devices are supplied packed in conducting foam or other suitable carriers.

SP8000 SERIES HIGH SPEED DIVIDERS

SP8785B&M 1.0GHz ÷ 20/22
SP8786B&M 1.3GHz ÷ 20/22
UHF PROGRAMMABLE DIVIDERS

FEATURES
- DC to 1.3GHz operation
- 0°C to +70°C operation (B Grade)
- −40 to +85°C operation (M grade)
- Complementary outputs and control inputs are ECL 10K/ECL III compatible.
- AC coupled clock input with wide dynamic range.

QUICK REFERENCE DATA
- Supply voltage $V_{CC}-V_{EE}$ = 5.2V ± .25V
- Power Consumption 440 mW typ (no load)
- ECL compatible
- Maximum input frequency 1GHz (SP8785), 1.3GHz (SP8786)
- Control loop delay time 12 ns typ with 1.3GHz input.

Fig. 1 Pin connections (viewed from above)

DG16

The SP8785 B & M and SP8786 B & M are high speed programmable ÷20/22 counters which operate at input frequencies up to 1.0GHz and 1.3GHz respectively over the temperature ranges 0°C to +70°C (B grade) and −40°C to +85°C (M grade).

The clock input is biased internally and is coupled to the signal source by a capacitor. The input RF path is completed by two input reference decoupling capacitors which are connected to earth.

The division ratio is controlled by two PE inputs. The counter will divide by 20 when either input is in the high state and by 22 when both inputs are in the low state. These inputs are ECL III/10K compatible and have internal 4.3KΩ pulldown, unused inputs may therefore be left open. When using the device as a ÷20 prescaler the inverse output should be connected to a PE input.

In keeping with the device performance the complementary outputs are ECL 10K compatible.

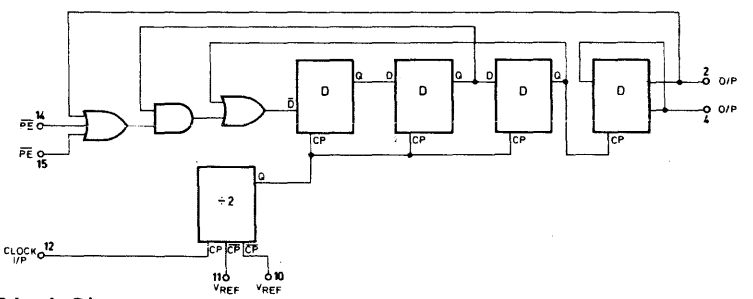

Fig. 2 Logic Diagram

Clock Pulse	Q1	Q2	Q3	Q4
2	L	H	H	H
4	L	L	H	H
6	L	L	L	H
8	H	L	L	H
10	H	H	L	H
12	L	H	H	L
14	L	L	H	L
16	L	L	L	L
18	H	L	L	L

22	H	H	H	H

$\overline{PE}$	PE	DIV RATIO
L	L	22
H	L	20
L	H	20
H	H	20

The maximum possible loop delay for control is obtained if the L → H transition from Q4 or the H → L transition from Q4 is used to clock the stage controlling the ÷20/22. The loop delay is 20 clock periods minus the internal delays of the ÷20/22 circuit.

ELECTRICAL CHARACTERISTICS

Test conditions (unless otherwise stated):
Tamb 0°C to +70°C (B Grade)
−40°C to + 85°C (M Grade)
Supply voltage V_{CC}=OV
V_{EE}=−5.2V*

Static characteristics

Characteristic	Value Min.	Typ.	Max.	Units	Conditions
PE input voltage V_{INH}	−.96		V_{CC}	V	Tamb = 25°C
V_{INL}	V_{EE}		−1.62	V	see note 2
PE input pulldown resistor		4.3		KΩ	
Output Voltage levels					
V_{OH}	−.93		−.78	V	Tamb = 25°C
V_{OL}	−1.85		−1.62	V	430Ω from o/p to V_{EE} see note 2
Power supply current		85	115	mA	No load

* The SP8785/6 may be operated with a +5.2V supply provided sufficient care is taken with supply decoupling and interfacing of input and outputs.

Dynamic characteristics

Characteristic	Value Min.	Typ.	Max.	Units	Conditions
Max. toggle frequency					
SP8786	1300			MHz	See Note 3
SP8785	1000			MHz	
Min. frequency sinewave drive			150	MHz	
Min. slew rate of square wave for correct operation to D.C.			200	V/μS	
Propagation delay clock input to output		2.5		μS	
Set up time		.5		nS	See note 4
Release time		.5		nS	See note 5

NOTES:
1. Correct operation is specified for $V_{CC} - V_{EE}$ = 5.2V ±.25V.
2. The input threshold and output voltage levels have the same temperature coefficient as ECL 111/10K.
3. The devices are dynamically tested using the circuit shown in Fig. 4 with input amplitudes of 400 and 1000 mVpp over the full temperature range.
4. Set up is defined as the minimum time that can elapse between a L → H transition of control input and the last L → H clock pulse transition to ensure the ÷20 mode is selected.
5. Release time is defined as the minimum time that can elapse between a H → L transition of the control input and the last L → H clock pulse transition to ensure the ÷22 mode is selected.

SP8000 SERIES
HIGH SPEED DIVIDERS

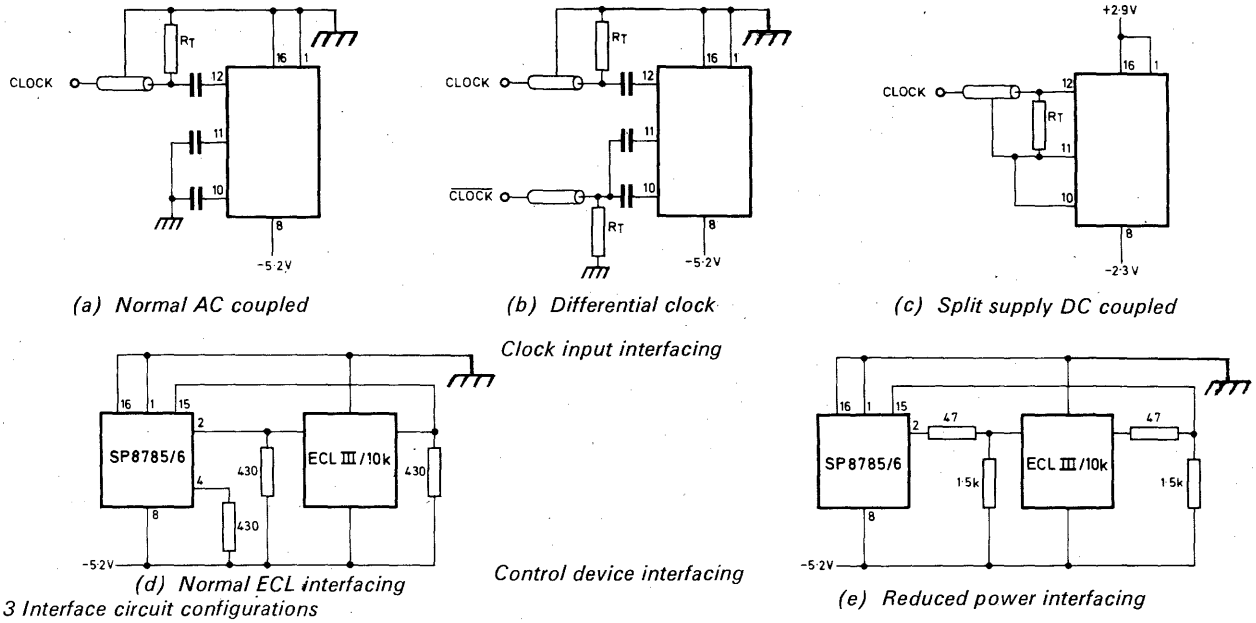

Fig. 3 Interface circuit configurations

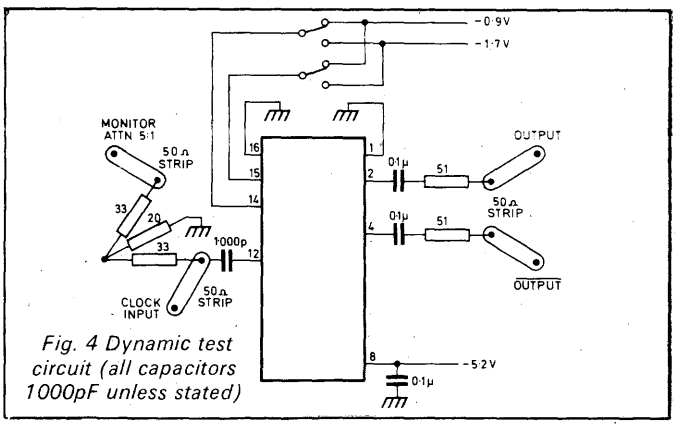

Fig. 4 Dynamic test circuit (all capacitors 1000pF unless stated)

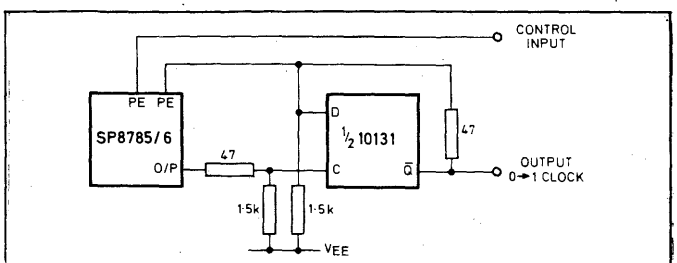

Fig. 5 40/42 control loop delay time 24ns typ

OPERATING NOTES

It is recommended that high frequency construction techniques are used with these devices with the positive rail connected to a ground plane. All components used in the circuit layout should be suitable for the frequencies involved.

The clock input to the device is normally capacitively coupled to the signal source as shown in Fig. 3a. The input is self biased by an internal 400Ω resistor to a bias voltage, and in order to complete the input path the two input reference pins must be decoupled to the earth plane with minimum of series inductance. Alternative connections which allow the use of complementary drive or DC coupling for added sensitivity are also shown in Fig. 3.

In the absence of an input signal, circuit will self oscillate with an output frequency of approximately 50MHz. This can be prevented by connecting a 10KΩ resistor between pin 11 and the negative rail. This offsets the input sensitivity by approximately 100mV.

The SP8785/6 will miscount with low frequency sinewave inputs or slow ramps. A slew of 200V/µs or greater is necessary for safe operation at low frequencies.

The input impedance of the SP8785/6 is a function of frequency and minimises at about the same frequency as the maximum input sensivity, so although it can load the signal source significantly there is generally enough signal to operate the device satisfactorily when the input impedance is at a minimum. The worst case occurs at the maximum frequency because this is where the input sensitivity is worst.

The modulus control inputs have been designed to interface directly to ECL III/ECL10k since on ECL counter such as the 10136 is required to directly control the device at the maximum input clock frequency. If the input frequency is reduced or the modulus extended as shown in the application notes, the device may be controlled by a TTL. or CMOS. counter provided the loop delay requirements are met and suitable interfacing is applied. Unused PE inputs should be left open circuit.

The SP8785/6 have outputs which are compatable with the ECL 10k logic family. The device will drive 100Ω lines and can be used with line impedances down to 50Ω with a small loss in noise immunity.

An equal load on the unused output will reduce waveform distortion.

APPLICATION NOTES

The SP8785/6 when used in a system operating at 1.3GHz may be controlled by a variable divider to give effective variable division at half the input frequency. The variable divider must produce a control signal within the period of the output of the SP8785/6 minus the delays within this device. The control loop delay time is typically 12 nsec.

Two methods may be used to achieve a satisfactory delay time within the control divider—

1. An extra divider may be inserted to increase the division ratio of the two modulus from 20/22 to 40/42, 80/82 or 100/102, hence reducing the control divider frequency and increasing the control loop delay time.
2. An ECL variable counter may be used to produce the control command. A device which is suitable is the 10136, in the ECL10k range.

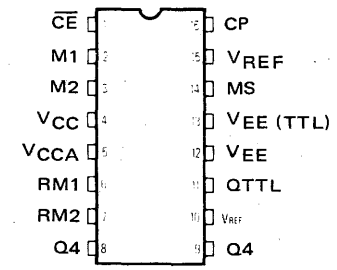
SP8680A&B
HIGH SPEED DIVIDERS

SP8680 A & B
600 MHz–10/11
U.H.F. PROGRAMMABLE DIVIDERS



FEATURES

- D.C. to 600 MHz operation
- ECL and TTL compatible
- D.C. or A.C. clock input
- Clock enable
- Asynchronous master set

QUICK REFERENCE DATA

- Supply voltage ($V_{CC}-V_{EE}$) =5.0 V +0.5 V −0.25 V
- Power consumption 400 mW typ. (no load)
  T.T.L. output 20 mW typ.
- Maximum input frequency 600 MHz SP8680B
  550 MHz SP8680A
  Input amplitude (a.c. coupled)
  350 mV to 700 mV.

Fig. 1 Pin Connections (Top View)

The SP8680 A & B are high speed programmable–10/11 counters which operate at input frequencies up to 600 MHz over the temperature ranges −55°C to +125°C (A grade), −30°C to +70°C (B grade). The devices operate on a single +5 V or −5.2 V power supply and may be easily interfaced to E.C.L. or T.T.L. logic. The clock input may be directly coupled to E.C.L., or (by connecting the internal V_{REF}) capacitively coupled to the signal source. A clock enable, which is E.C.L. compatible, is provided.

The division ratio is controlled by two mode inputs which are also ECL compatible. The counter will divide by 10 when either input is in the high state and by 11 when both inputs are low. The counter may be set to the eleventh state by applying a high level to the M5 input. The set command is asynchronous and overrides the clock input. All inputs have internal 50 k Ω pull down resistors, so that unused inputs may be left open circuit.

Two complementary ECL outputs are provided. They are both capable of driving 50 Ω lines. A T.T.L. push pull output is also provided which may be powered up separately from the counter using the V_{EE} on pin 13.

Absolute Maximum Ratings

Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits. The table of Electrical Characteristics provides conditions for actual device operation.

Power Supply Voltage	$[V_{CC}(V_{CCA})-V_{EE}]$ −0.5 to +7V
Input Voltage	V_{EE} to V_{CC}
ECL Output Source Current	−50 mA
TTL Output Sink Current	30 mA
Voltage applied to TTL Ouput High	V_{EE} to V_{CC}
Operating Ambient Temperature	−55°C to +125°C
Storage Temperature	−55°C to +150°C

TTL Output Fall Time		3		nsec	

NOTES:
1. The SP8680 may be used in a positive earth system with V_{CC} = 0V and V_{EE} = −4.75V to −5.5V
2. The input threshold has a temperature coefficient of 0.8mV/°C. This may be used to calculate V_{INH} and V_{INL} values at the temperature extremes.
3. The E.C.L. outputs are capable of driving a 50Ω load to +3.2V over a limited temperature range of 0°C to 70°C. The output high level will be reduced by typically 50mv.

©IC MASTER 1979

The output high level has a temperature coefficient of 1.2 mV/°C, whilst the output iow level has a coefficient of 0.2 mV/°C.

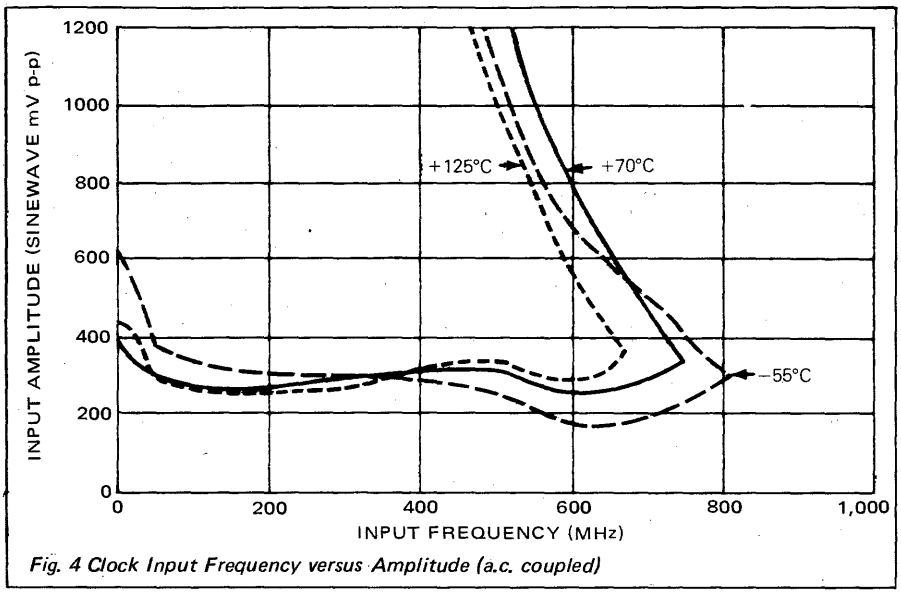

Fig. 4 Clock Input Frequency versus Amplitude (a.c. coupled)

N.B.
The graphs on the left are with the TTL output connected. Sensitivity in the 300 to 500MHz frequency range is improved by of the order of 100mV p-p when pin 13 is disconnected.

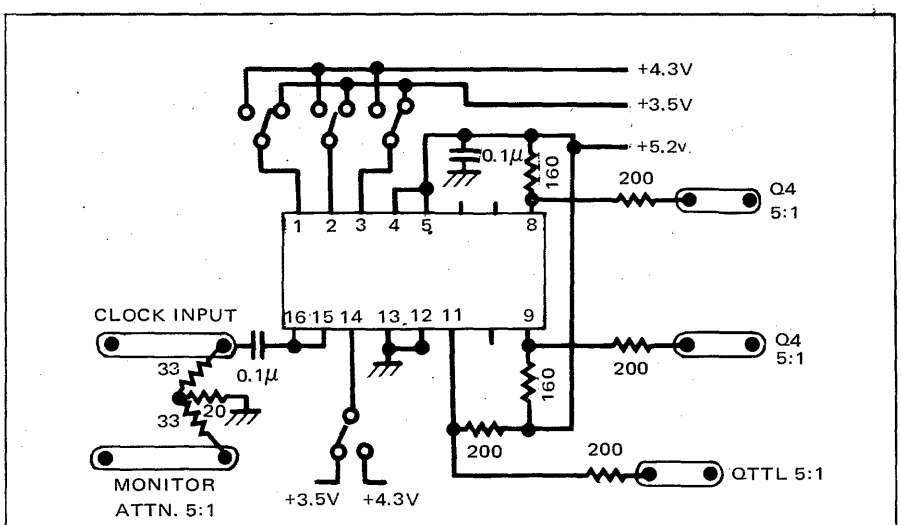

Fig. 5 Dynamic test circuit

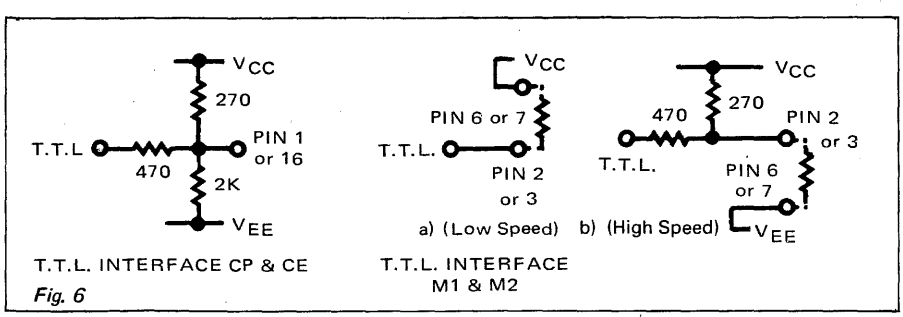

Fig. 6

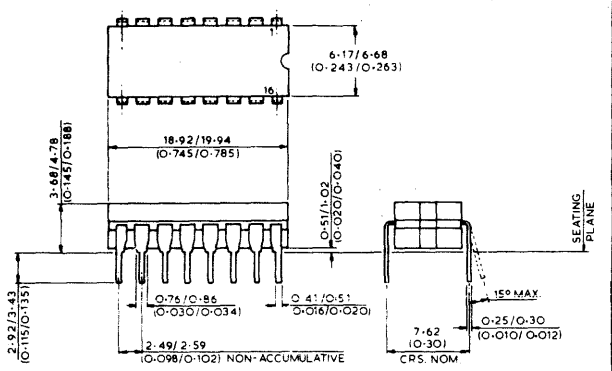
OPERATING NOTES

The SP8680 is designed to operate in the UHF band and therefore PCB layouts should comply with norman UHF rules, e.g. short tracks, low inductance capacitors etc.

All clock and control inputs are compatible with ECL 10K throughout the temperature range. The clock input may be capacitively coupled by connecting pin 16 to pin 15. All inputs may be interfaced with T.T.L. logic as shown in Fig. 6.

PLESSEY
SEMICONDUCTORS



SP8680A&B
HIGH SPEED DIVIDERS

Two E.C.L. compatible outputs are available (true and inverse) both capable of driving a 100 Ω load (to +3.2V) over the full temperature range. These outputs have no internal pull down so an external resistor to V_{EE} is required when interfacing to other E.C.L. logic. A T.T.L. output is also provided which is powered up by connecting pin 13 to V_{EE}.

The SP8680 may be controlled by a following variable divider to produce effective variable division at up to 600 MHz. Some points to be noted when this technique is employed are as follows:—

1) The 0—1 edge of the Q4 or TTL outputs must be used to clock the following divider. This gives a maximum control loop delay time (equal to ten clock periods minus internal delays).
2) At 600 MHz the required control loop delay time is only 13 nsec (using ECL outputs) and hence only an E.C.L. variable divider can be used in the control loop. A suitable device is the 10136.
3) To overcome the above problem the modulus may be be extended from 10/11 to 20/21, 40/41, or 100/101. This will considerably increase the control loop delay time, so that a TTL variable divider may be used in the control loop.
4) The minimum division number of a 'two modulus' n/n + 1 when employed as a fully variable divider is n(n—1). Therefore for a 10/11 this will give 90. If the modulus has been extended to 100/101 the minimum divide will be 9,900 which may well be too large.
5) If the above two modulus approach does not give a satisfactory systems solution then a four modulus system may be required. An example of this would be a 100/101/110/111 followed by two control dividers. The two control dividers decide on the number of +1 and +10 counts required. The minimum division number of such a system is 900.

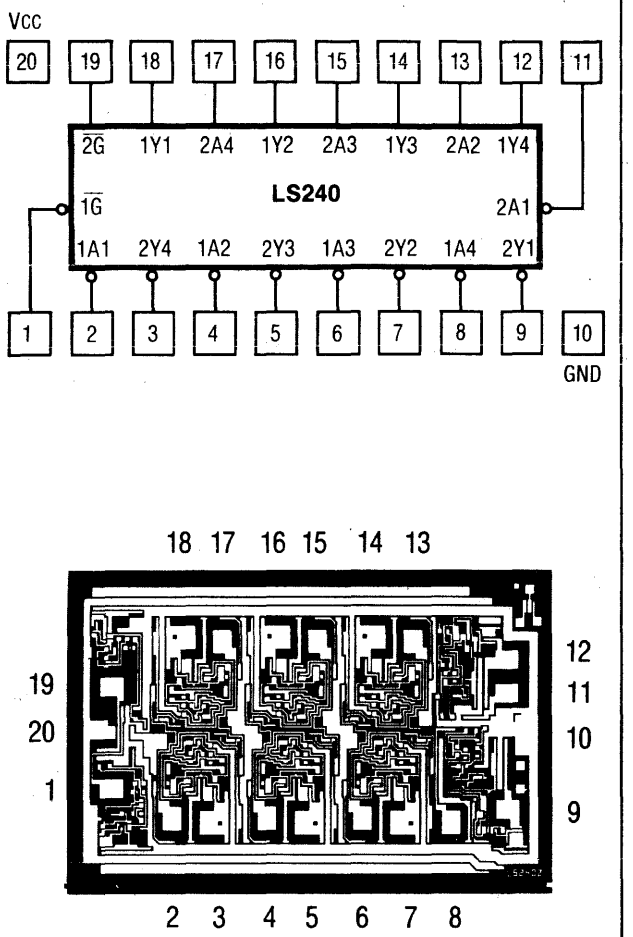
LS240 Octal Three-State Inverting Drivers

Features

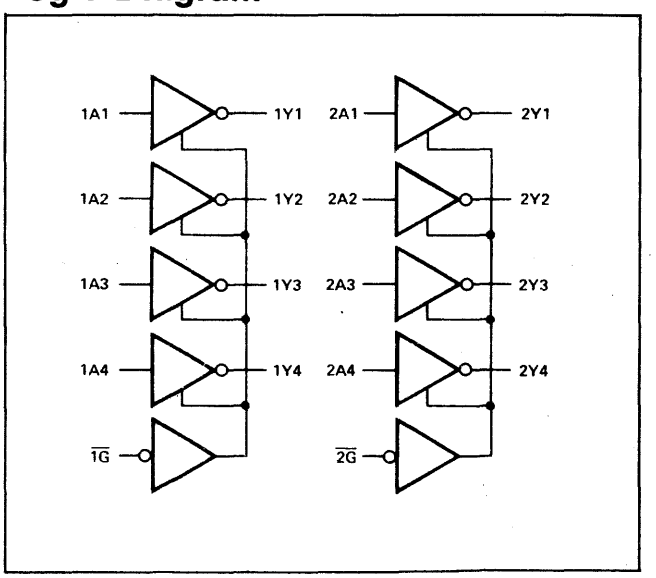
- Three-state outputs drive bus lines directly
- Hysteresis at inputs improve noise margin
- PNP inputs reduce D.C. loading on bus lines
- Data-to-output propagation delay times—18ns Max.
- Enable-to-output—30ns Max.
- 20 pin hermetic and molded DIP packages



Description

The LS240 is an octal inverting line driver fabricated using advanced low-power Schottky technology.

Three-state outputs are provided to drive bus lines directly with an output sink current guaranteed at 12mA over the military range and 24mA over the commercial range. Four buffers are enabled from one common line and the other four from a second enable line.



Improved noise rejection and high fan-out are provided by input hysteresis and low current PNP inputs.

Octal Three-State Buffers

LS241 LS244

Features

- Three-state outputs drive bus lines directly
- Hysteresis at inputs improve noise margin
- PNP inputs reduce D.C. loading on bus lines
- Data-to-output propagation delay times—18ns Max.
- Enable-to-output—30ns Max.
- 20 pin hermetic and molded DIP packages

Description

The LS241 and LS244 are octal buffers fabricated using advanced low-power Schottky technology.

Three-state outputs are provided to drive bus lines directly with an output sink current guaranteed at 12mA over the military range and 24mA over the commercial range. Four buffers are enabled from one common line and the other four from a second enable line.

The LS241 has enable inputs of opposite polarity to allow use as a transceiver without overlap. The LS244 enables are of similar polarity for use as a unidirectional buffer in which both halves are enabled simultaneously.

Improved noise rejection and high fan-out are provided by input hysteresis and low current PNP inputs.

LS242 LS243

Quad Bus Transceivers with Three-State Outputs

Features

- Three-state outputs drive bus lines directly
- Hysteresis at inputs improve noise margin
- PNP inputs reduce D.C. loading on bus lines
- Data-to-output propagation delay times—18ns Max.
- Enable-to-output—30ns Max.
- LS242 and LS243 are specified at 48mA output current

Description

The LS242 and LS243 are quad bus transceivers designed for asynchronous two-way communications between data buses.

The LS242 and LS243 have the two 4-line data paths connected input-to-output on both sides to form an asynchronous transceiver/buffer with complementing enable inputs. The LS242 is inverting, while the LS243 presents non-inverting data at the outputs.

Three-state outputs are provided to drive bus lines directly with an output sink current guaranteed at 12mA over the military range and 24mA over the commercial range.

Improved noise rejection and high fan-out are provided by input hysteresis and low current PNP inputs.

Octal D-Type Flip-Flop with Clear LS273

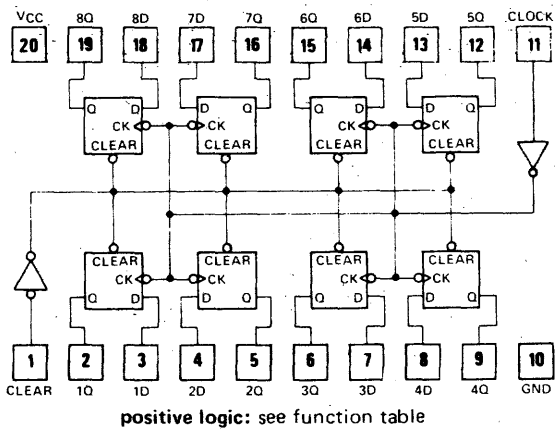
Features

- Contains eight flip-flops with single-rail outputs
- Buffered clock and direct clear inputs
- Individual data input to each flip-flop

Description

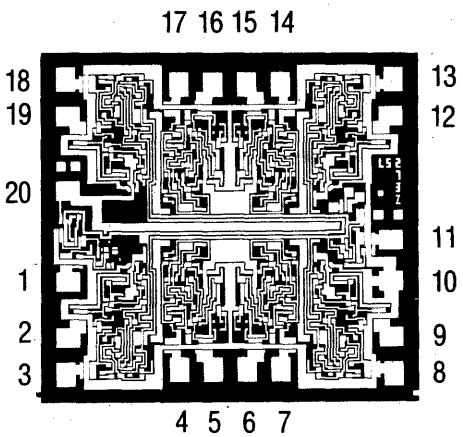
These monolithic, positive-edge-triggered flip-flops utilize TTL circuitry to implement D-type flip-flop logic with a direct clear input.

Information at the D inputs meeting the setup time requirements is transferred to the Q outputs on the positive-going edge of the clock pulse. Clock triggering occurs at a particular voltage level and is not directly related to the transition time of the positive-going pulse. When the clock input is at either the high or low level, the D input signal has no effect at the output.



These flip-flops are guaranteed to respond to clock frequencies ranging from 0 to 30MHz while maximum clock frequency is typically 40MHz. Typical power dissipation is 10mW for the LS273.

Function Table



(Each Flip-Flop)

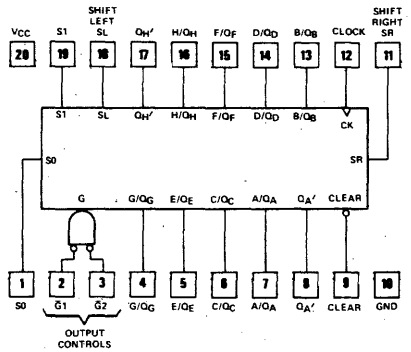
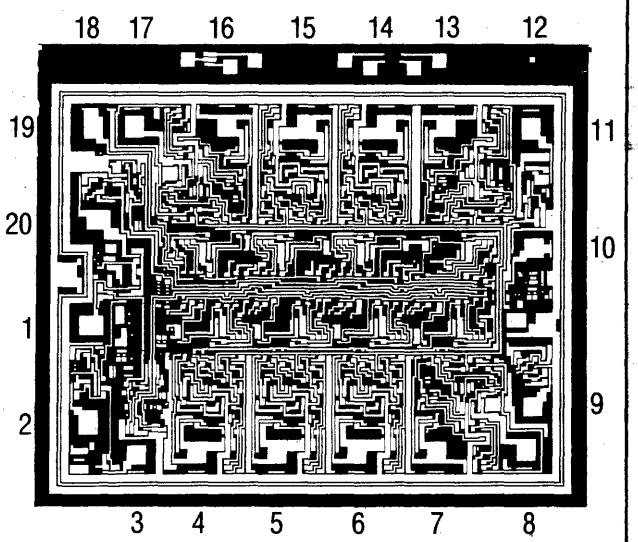
8-Bit Universal Shift/Storage Registers LS299

Features



- Multiplexed inputs/outputs provide improved bit density
- Four modes of operation:
  Hold (store) Shift Left
  Shift Right Load Data
- Operates with outputs enabled or at high Z
- 3-state outputs drive bus lines directly
- Can be cascaded for n-bit word lengths
- 54LS299 and 74LS299 are similar but have synchronous clear
- Guaranteed shift (clock) frequency—35MHz
- Typical power dissipation—175mW

Description



These Schottky TTL eight-bit universal registers feature multiplexed inputs/outputs to achieve full eight bit data handling in a single 20-pin package. Two function-select inputs and two output-control inputs can be used to choose the modes of operation listed in the function table.

Synchronous parallel loading is accomplished by taking both function-select lines, S0 and S1, high. This places the three-state outputs in a high-impedance state, which permits data that is applied on the input/output lines to be clocked into the register. Reading out of the register can be accomplished while the outputs are enabled in any mode. A direct overriding input is provided to clear the register whether the outputs are enabled or off.

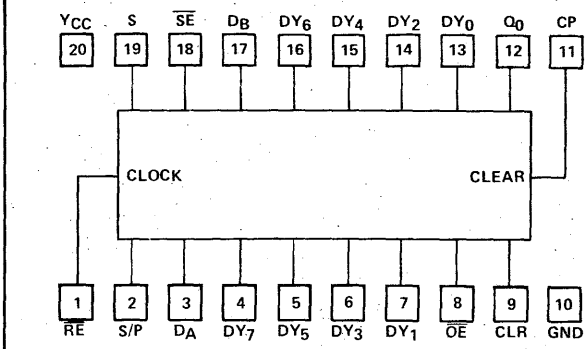
8-Bit Shift/Storage Register with Synchronous Clear

LS322

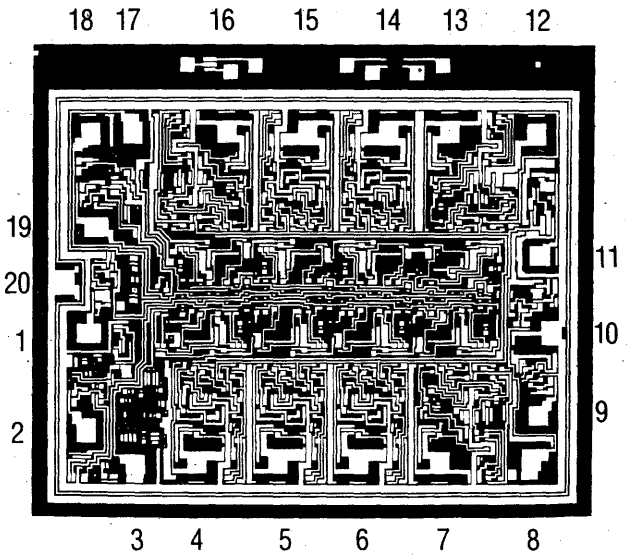
Features

- Three-state outputs
- Multiplexed serial data input
- Sign extend function
- Advanced low-power Schottky processing



Description

The LS322 is an eight-bit serial/parallel register built using advanced Low-Power Schottky processing. The device features an eight-bit parallel multiplexed input/output port to provide improved bit density in a 20-pin package. Data may be loaded into the device in a serial manner from either input D_A or D_B. A serial output, Q_0, is also provided.



The LS322 is specifically designed for operation with the LS384 serial/parallel two's complement multiplier and provides the sign extend function required for this device.

When the Register Enable ($\overline{RE}$) input is HIGH, the register will retain its current contents. Synchronous parallel loading is accomplished by applying a LOW to $\overline{RE}$ and applying a LOW to the Serial/Parallel (S/P) input. This places the three-state outputs in the high-impedance state independent of $\overline{OE}$ and allows data that is applied on the input/output lines (DY_j) to be clocked into the register. When the S/P input is HIGH, the device will shift right. The Sign Extend ($\overline{SE}$) input is used to repeat the sign in the Q_7 flip-flop. This occurs whenever $\overline{SE}$ is LOW when the SHIFT mode is selected. When $\overline{SE}$ is HIGH, the serial two-input multiplexer is enabled. Thus, either D_A or D_B can be selected to load data serially. The register changes state on the LOW-to-HIGH transition of the clock. A clear input (CLR) is used to asynchronously reset all flip-flops when a LOW is applied.

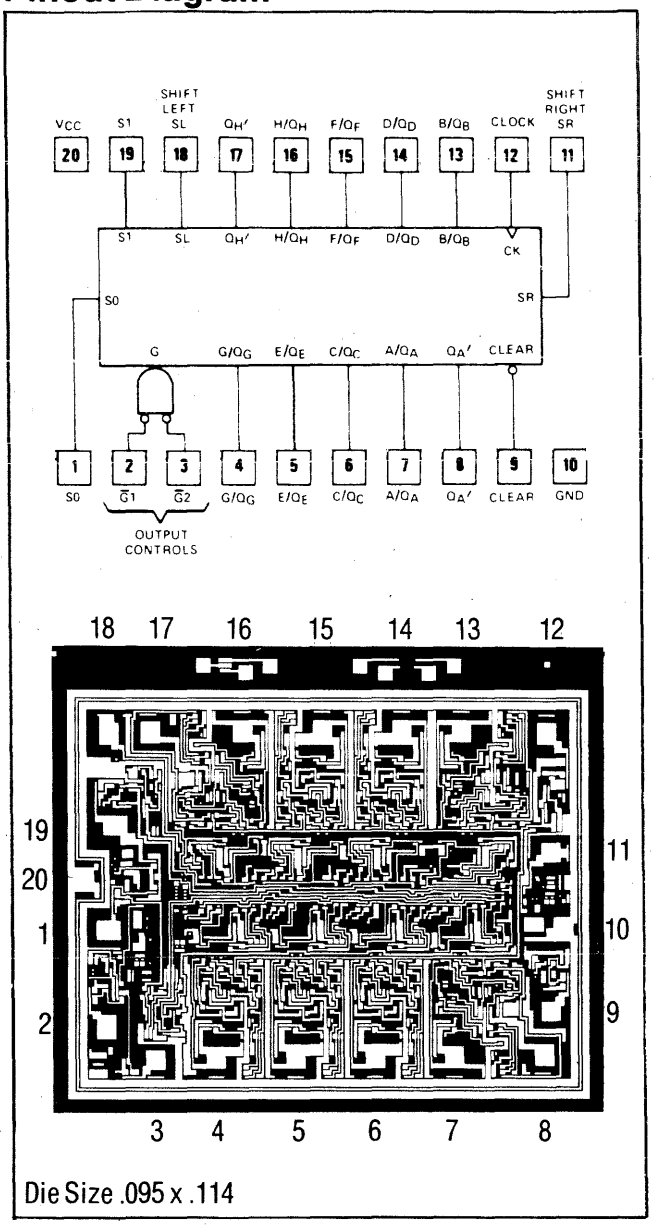
LS323 8-Bit Universal Shift/Storage Registers



Features

- Multiplexed inputs/outputs provide improved bit density
- Four modes of operation:
  Hold (store) Shift Left
  Shift Right Load Data
- Operates with outputs enabled or at high Z
- 3-state outputs drive bus lines directly
- Can be cascaded for n-bit word lengths
- Typical power dissipation—175mW
- Guaranteed shift (clock) frequency—35MHz
- 9LS/54LS299 and 9LS/74LS299 are similar but have direct overriding clear

Description

These Low-Power Schottky eight-bit universal registers feature multiplexed inputs/outputs to achieve full eight-bit data handling in a single 20-pin package. Two function-select inputs and two output-control inputs can be used to choose the modes of operation listed in the function table. Synchronous parallel loading is accomplished by taking both function-select lines, S0 and S1, high. This places the three-state outputs in a high-impedance state, which permits data that is applied on the input/output lines to be clocked into the register. Reading out of the register can be accomplished while the outputs are enabled in any mode. The clear function is synchronous and a low level at the clear input clears the register on the next low-to-high transition of the clock.

Octal D-Type Transparent Latches and Edge-Triggered Flip-Flops

LS373 LS374

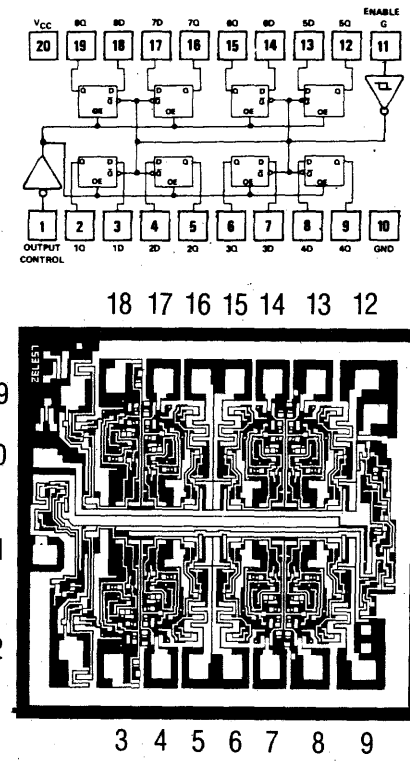
Features

- Choice of 8 latches or 8 D-type flip-flops in a single package
- 3-state bus-driving outputs
- Full parallel-access for loading
- Clock/Enable input has hysteresis to improve noise rejection
- 54LS363 and 74LS364 are similar but have higher V_{OH} for MOS interface

Description

These 8-bit registers feature totem-pole three-state outputs designed specifically for driving highly-capacitive or relatively low-impedance loads. The high-impedance third state and increased high-logic-level drive provide these registers with the capability of being connected directly to and driving the bus lines in a bus-organized system without need for interface or pull-up components. They are particularly attractive for implementing buffer registers, I/O ports, bi-directional bus drivers, and working registers.

The eight latches of the LS373 are transparent D-type latches meaning that while the enable (G) is high the Q outputs will follow the data (D) inputs. When the enable is taken low the output will be latched at the level of the data that was setup.



The eight flip-flops of the LS374 are edge-triggered D-type flip flops. On the positive transition of the clock, the Q outputs will be set to the logic states that were setup at the D inputs.

Schmitt-trigger buffered inputs at the enable/clock lines simplify system design as AC and DC noise rejection is improved by typically 400mV due to the input hysteresis. A buffered output control input can be used to place the eight outputs in either a normal logic state (high or low logic levels) or a high-impedance state. In the high-impedance state the outputs neither load nor drive the bus lines significantly.

The output control does not affect the internal operation of the latches or flip-flops. That is, the old data can be retained or new data can be entered even while the outputs are off.

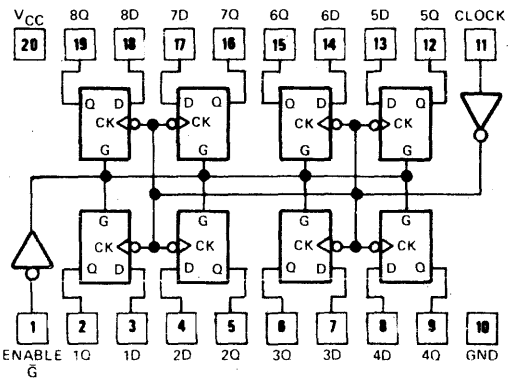
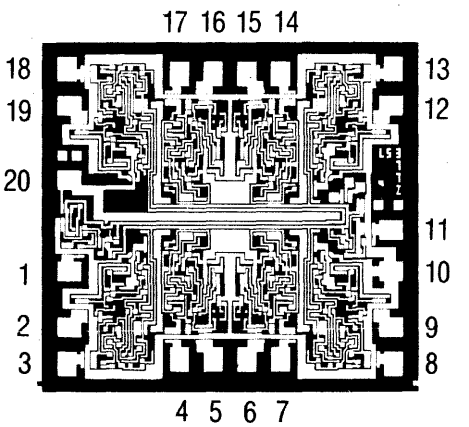
LS377 Octal D-Type Flip-Flops with Enable

Features

- LS377 contains eight flip-flops with single-rail outputs
- Individual data input to each flip-flop



Description



These monolithic, positive-edge-triggered flip-flops utilize TTL circuitry to implement D-type flip-flop logic with an enable input. The LS377 is similar to the LS273, but features a common enable instead of a common clear.

Information at the D inputs meeting the setup time requirements is transferred to the Q outputs on the positive-going edge of the clock pulse if the enable input G is low. Clock triggering occurs at a particular voltage level and is not directly related to the transition time of the positive-going pulse. When the clock input is at either the high or low level, the D input signal has no effect at the output. The circuits are designed to prevent false clocking by transitions at the G input.

These flip-flops are guaranteed to respond to clock frequencies ranging from 0 to 30MHz while maximum clock frequency is typically 40MHz. Typical power dissipation is 10mW per flip-flop.

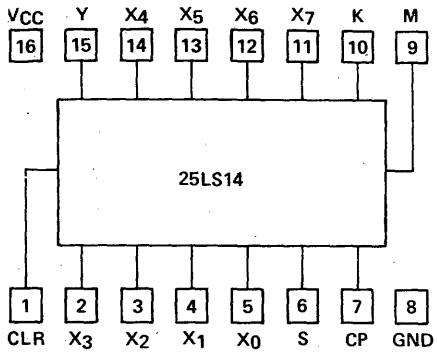
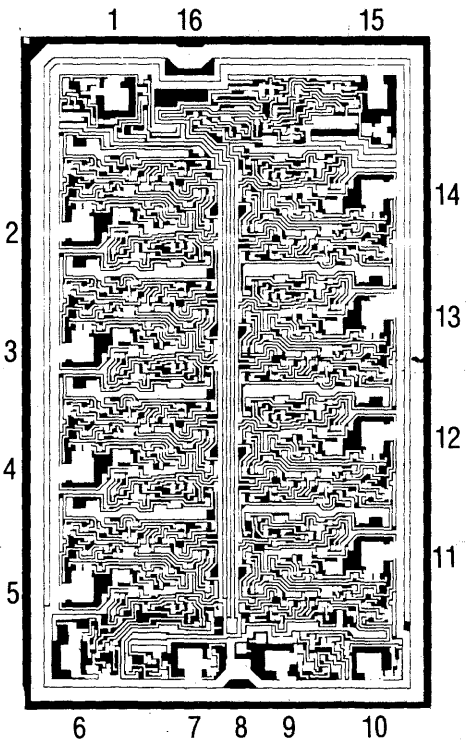
8-Bit Serial/Parallel Two's Complement Multiplier

LS384

Description



The LS384 is an 8-bit by 1-bit sequential logic element that performs digital multiplication of two numbers represented in two's complement form to produce a two's complement product without correction by using Booth's algorithm internally. The device accepts an 8-bit multiplicand (X input) and stores this data in eight internal latches. The X latches are controlled via the clear input. When the clear input is LOW, all internal flip-flops are cleared and the X latches are opened to accept new multiplicand data. When the clear input is HIGH, the latches are closed and are insensitive to X input changes.



The multiplier word data is passed by the Y input in a serial bit stream—least significant bit first. The product is clocked out the S output least significant bit first.

The multiplication of an m-bit multiplicand by an n-bit multiplier results in an m + n bit product. The LS384 must be clocked for m + n clock cycles to produce this two's complement product. Likewise, the n-bit multiplier (Y-input) sign bit data must be extended for the remaining m-bits to complete the multiplication cycle.

The device also contains a K input so that devices can be cascaded for longer length X words. The sum (S) output of the device is connected to the K input of the succeeding device when cascading. Likewise, a mode input (M) is used to indicate which device contains the most significant bit. The mode input is wired HIGH or LOW depending on the position of the 8-bit slice in the total X word length.

↑ = LOW-to-HIGH transition
CS = Connected to S output of higher order device
OP = X_i latches open for new data (1 = 0, 7)
AR = Output as required per Booth's algorithm

Definition of Functional Terms

X_0, X_1, X_2, X_3, X_4, X_5, X_6, X_7 The eight data inputs for the multiplicand (X) data.

Y The serial input for the multiplier (Y) data—least significant bit first.

S The serial output for the product of X Y—least significant bit first.

CP Clock The buffered common clock input for the serial/parallel multiplier. All functions occur on the LOW-to-HIGH transition of the clock.

CLR Clear The buffered common clear for all flip-flops withing the device. When the clear is LOW all flip-flops are cleared. Also the buffered X-input latch enable. When the clear input is LOW, the X latches will accept new X-input data.

K The sum expansion input to the serial/parallel multiplier. Allows for cascading devices.

M The mode control input for the most significant bit of the multiplier. It is used in conjunction with cascading to determine the most significant bit.

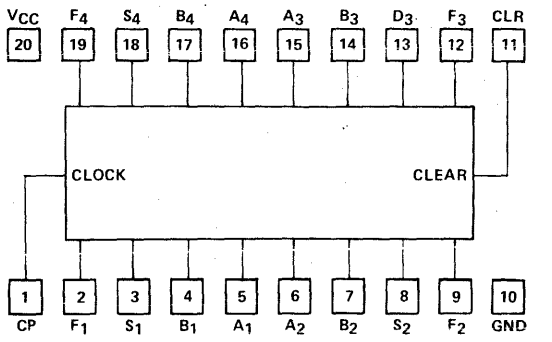
LS385 Quad Serial Adder/Subtractor

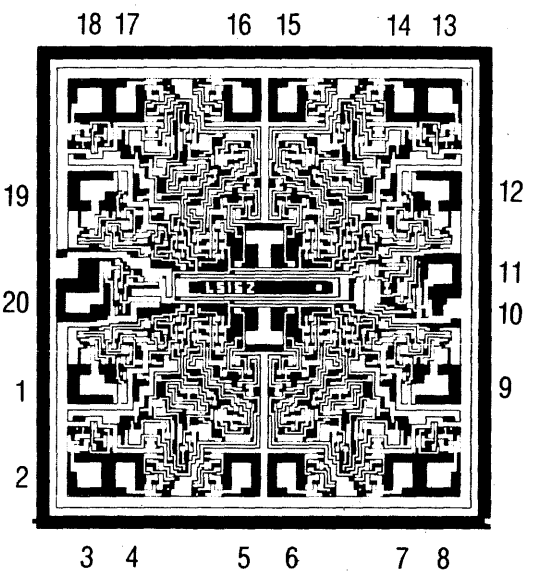
Features

- Four independent adder/subtractors
- Use with two's complement arithmetic
- Magnitude only addition/subtraction
- Advanced low-power Schottky



Description

The LS385 is a serial two's complement adder/subtractor designed for use in association with the LS384 serial/parallel two's complement multiplier. This device can also be used for magnitude only or one's complement addition or subtraction.



Four independent adder/subtractors are provided with common clock and clear inputs. The add function is A plus B and the subtract function is A minus B. The clear function sets the internal carry function to logic zero in the add mode and to logic one in subtract mode. This least significant carry is self propagating in the subtract mode as long as zeroes are applied to the A and B inputs at the LSB's. All internal flip-flops change state on the LOW-to-HIGH clock transition.

The LS385 is particularly useful for recursive or non-recursive digital filtering or butterfly networks in Fast Fourier Transforms.

C = Data in the carry flip-flop before the clock transition

C_1 = Data in the carry flip-flop after the clock

X = Don't Care

NC= No Change

H = HIGH

L = LOW

↑ = LOW-to-HIGH Transision

Definition of Functional Terms

A_1, A_2, A_3, A_4 The "A" input into each adder/subtractor.

B_1, B_2, B_3, B_4 The "B" input into each adder/subtractor.

S_1, S_2, S_3, S_4 The add subtract control for each adder/subtractor. When S is LOW, the F function is A + B. When S is HIGH, the F function is A - B.

F_1, F_2, F_3, F_4 The four independent serial outputs of the adder/subtractor.

CP Clock The clock input for the device. All internal flip-flops change state on the LOW-to-HIGH transition.

CLR Clear When the clear input is LOW, the four independent adder/subtractors are asynchronously reset. The sum flip-flop is always set to logic "0". The carry flip-flop is set to logic "0" in the add mode and logic "1" in the subtract mode.

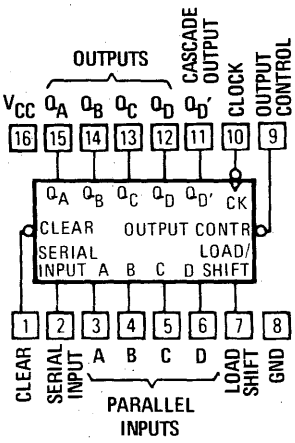
4-Bit Cascadable Shift Registers with 3-State Outputs

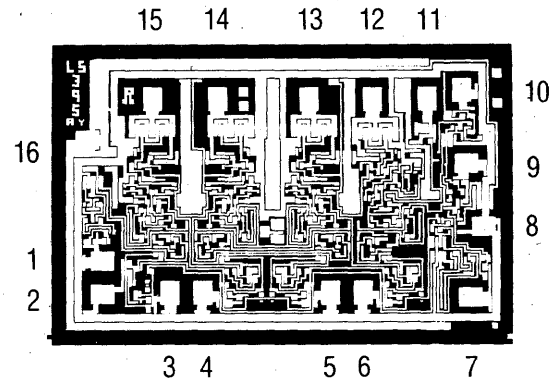
LS395A

Features

- Three-state, 4-bit, cascadable, parallel-in, parallel-out registers
- LS395A offers three times the sink-current capability of LS395
- Low power dissipation—75mW typical (enabled)
- Applications:
  - N-bit serial-to-parallel converter
  - N-bit parallel-to-serial converter
  - N-bit storage register



Description



These 4-bit registers feature parallel inputs, parallel outputs, and clock, serial, load/shift, output control and direct overriding clear inputs.

Shifting is accomplished when the load/shift control is low. Parallel loading is accomplished by applying the four bits of data and taking the load/shift control input high. The data is loaded into the associated flip-flops and appears at the outputs after the high-to-low transition of the clock input. During parallel loading, the entry of serial data is inhibited.

When the output control is low, the normal logic levels of the four outputs are available for driving the loads or bus lines the outputs are disabled independently from the level of the clock by a high logic level at the output control input. The outputs then present a high impedance and neither load nor drive the bus line; however, sequential operation of the registers is not affected. During the high-impedance mode, the output at Q_D' is still available for cascading.

Pinout Diagram

Die Size .063 x .098

Function Table

Inputs								3-State Outputs				Cascade
	Load/Shift			Parallel								Output
Clear	Control	Clock	Serial	A	B	C	D	Q_A	Q_B	Q_C	Q_D	Q_D'
L	X	X	X	X	X	X	X	L	L	L	L	L
H	H	H	X	X	X	X	X	Q_{A0}	Q_{B0}	Q_{C0}	Q_{D0}	Q_{D0}
H	H	↓	X	a	b	c	d	a	b	c	d	d
H	L	H	X	X	X	X	X	Q_{A0}	Q_{B0}	Q_{C0}	Q_{D0}	Q_{D0}
H	L	↓	H	X	X	X	X	H	Q_{An}	Q_{Bn}	Q_{Cn}	Q_{Cn}
H	L	↓	L	X	X	X	X	L	Q_{An}	Q_{Bn}	Q_{Cn}	Q_{Cn}

When the output control is high, the 3-state outputs are disabled to the high-impedance state; however, sequential operation of the registers and the output at Q_D' are not affected.

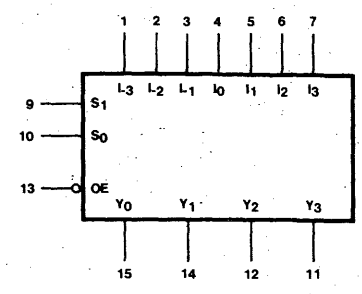
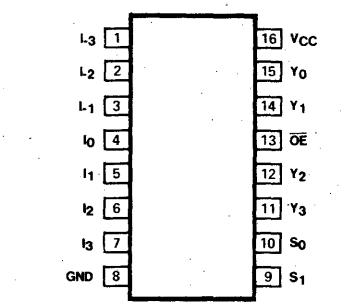
54S/74S350
(AM25S10)



DESCRIPTION

The "350" is a combinatorial logic circuit that accepts a 4-bit data word and shifts the word 0, 1, 2, or 3 places. The number of places to be shifted is determined by two Select inputs S_0 and S_1. The 3-state outputs allow expansion of shifting over a larger number of places.

FEATURES



- **Shifts 4-bits of data to 0, 1, 2, 3 places under control of two select lines**
- **3-State outputs for bus organized systems**
- **Alternate source AM25S10**

FUNCTIONAL DESCRIPTION

The "350" is a combination logic circuit that shifts a 4-bit word from "0" to "3" places. No clocking is required as with shift registers.

The "350" can be used to shift any number of bits any number of places up or down by suitable interconnection. Shifting can be:

1. Logical - with logic zeros filled in at either end of the shifting field
2. Arithmetic - where the sign bit is extended during a shift down
3. End around - where the data word forms a continuous loop.

The 3-state outputs are useful for bus interface applications or expansion to a larger number of shift positions in end around shifting. The active LOW Output Enable ($\overline{OE}$) input controls the state of the outputs. The outputs are in the high impedance "off" state when $\overline{OE}$ is HIGH, and they are active when $\overline{OE}$ is LOW.

TRUTH TABLE

$\overline{OE}$	S_1	S_0	I_3	I_2	I_1	I_0	I_{-1}	I_{-2}	I_{-3}	Y_3	Y_2	Y_1	Y_0

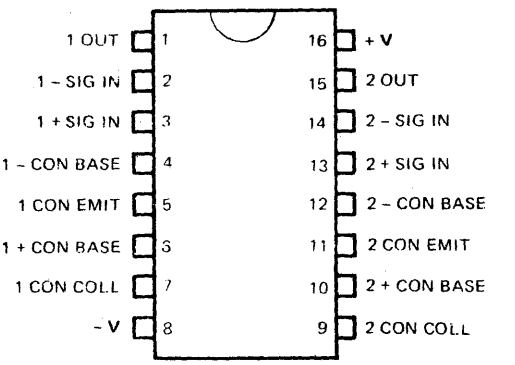
DUAL LINEAR-ANTILOG VOLTAGE CONTROLLED AMPLIFIER 2020

DESCRIPTION



The SSM 2020 is a dual two quadrant multiplier designed to be used with op amps in a wide variety of precision audio-frequency applications including AGC circuits, Dividers and as a Biquad tuning element. Each channel has separate control and differential signal inputs and a current output. The device offers an exceptionally flexible control circuit for each channel which allows simultaneous linear and exponential voltage control of gain or either polarity of current control. Both channels are fully temperature compensated and have 84dB signal to noise ratios at less than 0.1% distortion.

FEATURES

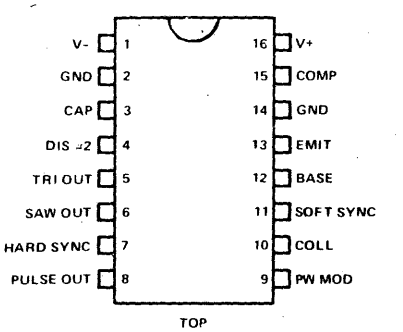
- Max Supplies ±18V
- Dual Design (Independent Control Selection)
- 2% Channel Gain Matching
- 100dB Control Range
- Simultaneous Linear and Exponential Gain Control
- Differential Signal Inputs
- Current Output
- 84dB Signal to Noise
- 0.1% Distortion
- Fully Temperature Compensated

APPLICATIONS

- 2 and 4 Quadrant Multipliers
- Dividers
- AGC Circuits
- Voltage Controlled Filters
- Voltage Controlled Quadrature Oscillators
- Volume Controls
- Equalizers
- Compandors
- Antilog Amplifiers
- Voltage Controlled Current Sources

VOLTAGE CONTROLLED OSCILLATOR 2030

SSM2030 DESCRIPTION



The SSM2030 is a precision voltage controlled oscillator designed specifically to meet the waveform and accuracy requirements of electronic music systems. It has both exponential and proportional linear sweep inputs which can control frequency over a 1,000,000 to 1 range with the same capacitor. Sweep accuracy is better than 0.25% over a 1,000 to 1 range and 0.1% over 100 to 1. The device has simultaneous sawtooth, triangle and pulse outputs. An internal comparator provides control of pulse output duty cycle from 0 to 100%. Hard and soft sync inputs make possible a rich variety of modulation and harmonic locking effects.

FEATURES

- Simultaneous Exponential and Proportional Linear Sweep Inputs
- High Sweep Accuracy (0.25% 1000 to 1)
- 1,000,000 to 1 Sweep Range
- 200 kHz Max Operating Frequency
- Simultaneous Sawtooth, Triangle and Pulse Outputs
- Pulse Duty Cycle Voltage Control Range (0 to 100%)
- All Outputs Short Circuit Protected
- Hard and Soft Sync Inputs
- Max Supplies ±18V

APPLICATIONS

- Music Synthesizers
- Electronic Organs
- Electronics Games
- Waveform Generation
- V to F and F to V Conversion
- Modulation Control Circuits
- Wide Range Phase-Locked Loops
- Frequency Multiplication and Division

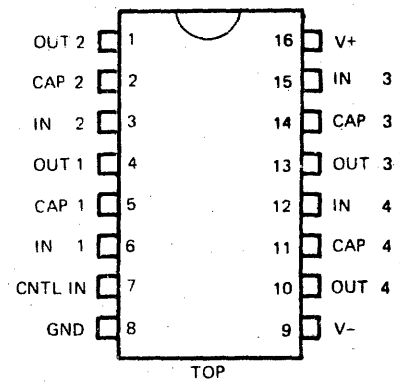
VOLTAGE CONTROLLED FILTER CIRCUIT 2040

DESCRIPTION

The SSM 2040 is a four section filter whose cutoff frequency can be exponentially voltage controlled over a 10,000 to 1 range. This flexible building-block can be used in virtually any active filter design including lowpass, highpass, bandpass and notch. Rolloff characteristics can be selected to be Butterworth, Bessel, Chevyshev, Cauer or any other filter type.



Applications include tracking filters, organs, music synthesizers, music phase shifters and sound effects generation.

FEATURES

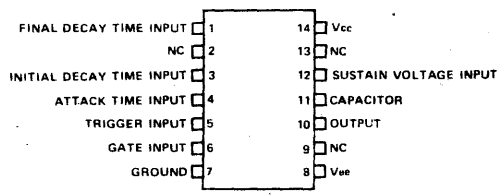
- +/- 15V Supplies
- Exponential Frequency Control Response
- 4 Filter Sections in One Package
- Low Noise
- Low Distortion
- Guaranteed Control Rejection Characteristics 10,000:1 range

APPLICATIONS

- Voltage Controlled Filters:
  - Lowpass
  - Bandpass
  - Highpass
  - Allpass
  - Notch
  - Biquad
  - State Variable
  - Sallen & Key
  - Cauer
- Parametric Equalizers
- Music Synthesizers
- Music Phase Shifters
- Tracking Filters
- Low Distortion Sine VCO's

VOLTAGE CONTROLLED TRANSIENT GENERATOR 2050

DESCRIPTION:



The SSM 2050 is a self-contained ADSR type electronic music transient generator. Attack, initial decay and final decay timers can be exponentially voltage controlled over a 10,000 to 1 range from 1 msec to more than 10 sec. The sustain level is linearly voltage controllable from 0 to 100%. The device has independant gate and trigger inputs for maximum flexibility and much effort has been taken to minimize the external parts count.

FEATURES:

- +/- 15V Supplies
- Exponential Time Control Response
- Minimum External Component Count
- Guaranteed Control Rejection Characteristics
- 10,000:1 Time Control Range
- Full ADSR Response
- Independent Gate & Trigger

APPLICATIONS

- Music Synthesizers
- Organs
- Rhythm Synthesizers
- Sound Effects Generators
- Electronic Games

Solid State Microtechnology For Music, Santa Clara, CA 95050, Phone (408)248-0917

INTRODUCTION TO INTERFACE

INTERFACE.....

The Master Selection Guide provides sufficient information to make initial product selections. It enables you to find the products which are most appropriate to fulfill your major requirements and then provides data for many of the more important products.

All devices that appear in this section, both in the initial selection guide and in the data pages, are included in all other indexes. These index listings lead to the page and the line on that page where each device appears.

In the Interface Section the selection parameters differ drastically for each category; therefore, each has its own format. The analog to digital converter category has two formats: one for binary output devices and another for decimal units. Some of the products in this section, primarily analog to digital and digital to analog converters, are hybrids; the ones listed are those packaged to be compatible with IC's.

This section is not complicated by reference to package styles; the package style suffixes are usually deleted. For more information on each companies' suffixes, see the Part Number Guide. Throughout the Master Selection Guide, each full military temperature range (−55°C to 125°C) device is indicated by a dagger (†) before the manufacturer's name. Manufacturers' names are normally spelled out; however, a few are abbreviated and the abbreviations are explained on page 306.

Decimal Output	584
Digital to Analog Converters	585
Display Drivers	601
Error Checking Circuits	604
Keyboard Encoders	605
Line Circuits	
Drivers	606
Receivers	611
Transceivers	615
Memory and Peripheral Drivers	619
Sense Amplifiers	624
Serial Transmitters-Receivers	625
Detailed Product Information provided by:	
American Microsystems Inc.	628
Burr-Brown	658
Datel Systems	660
Harris Semiconductor	692
Micro Power Systems	765
Monolithic Memories, Inc.	768
Motorola Semiconductor	778
National Semiconductor	793
Signetics	805
Siliconix	812
Supertex	834

The manufacturers listed above are providing detailed information on their latest and most significant products.
